A new spyware on Android pretends to be a system update for your phone to bypass security. <http://dgit.in/apr21-28>

Opportunity F19 Pro+ 5G

A familiar winning formula

Oppo F19 Pro+ 5G is powered by the MediaTek Dimensity 800U SoC, a chipset that Oppo and Realme seem very heavily invested in backing. Let's see if stand outs from the competition.

BUILD AND DESIGN

The Oppo F19 Pro+ 5G doesn't break any moulds when it comes to design, but it is still a good looking phone. We have the silver coloured variant, which has a pearl/satin type finish on the back. The whole thing is matte and does show fingerprints, but the visibility is low. The other interesting thing about the Oppo F19 Pro+ 5G happens to be the fact that it comes with an under-display fingerprint sensor, which is rare in this price segment. Construction wise, the phone feels like a really well built device, using a metal frame to hold the front and back together.

PERFORMANCE

The Oppo F19 Pro+ is powered by the MediaTek Dimensity 800U chipset, 6GB RAM and 128GB UFS 2.1 storage. This is the same hardware on the Realme Narzo 30 Pro, so the resulting benchmark numbers are almost the same. When we switch over to real-world performance, Gamebench reveals very minor differences in terms of gaming performance between the F19 Pro+ 5G and the Narzo 30 Pro. We got a median framerate of 59fps with 98 percent stability on the Oppo while on the Realme device, the media frame rate was 58fps with 84 percent stability. Suffice to say, when it comes to performance, the Oppo F19 Pro+ 5G does not offer anything over and above what the Narzo 30 Pro has to offer.

CAMERA

Where the Oppo F19 Pro+ 5G distinguishes itself is with respect to the camera. You have a 48MP primary

camera, 8MP ultra-wide camera, 2MP Macro camera, and depth sensor. When using the primary camera, what stands out is the relatively fast and reliable autofocus in both good and low light situations. When it comes to the output, the Oppo F19 Pro+ 5G does produce some nice images which could definitely be considered social media worthy.

The ultra-wide camera on the other hand is the same story as every other ultra-wide camera in the segment. You get no autofocus and halfway decent optics. This means you'll see distortion around the edges in your frame. The lack of autofocus limits you in terms of what you shoot and how you frame it.

We also have a macro camera on here which is very hard to use due to the lack of autofocus. Getting usable results from the Macro lens takes a lot of an effort, and even then it won't be that impressive of an image.

DISPLAY

The AMOLED display on the Oppo F19 Pro+ 5G presents a rather interesting case for displays on smartphones. We ran the display through a

Calman analysis and conclude that at the default setting, the display has far too much blue bias with respect to its white point, causing massive colour reproduction inaccuracies. Changing the colour profile from default to warm fixes the colour inaccuracies greatly, bringing the RGB balance to a much better value. Despite this, there are shades of blue that are still going to be inaccurately represented.

BATTERY LIFE

The Oppo F19 Pro+ 5G packs a 4310mAh battery with support for 50W fast charging. The presence of an AMOLED display does yield good battery numbers, but we feel that had Oppo stuck to a 5000mAh battery, we'd be seeing a day and a half of battery life instead of the one day that we have been getting so far. The battery life is decently acceptable and given the much faster charging method available, there's not a whole lot to complain. Watching an hour of Netflix drains the battery by just 14 percent, with the brightness set to roughly 80 percent.

VERDICT

The Oppo F19 Pro+ 5G is more about the design and slightly improved camera experience than it is about performance. In fact, its performance is so homogenous with other phones that sport the MediaTek Dimensity 800U chipset, that you could just as easily choose the Narzo 30 Pro and not feel the difference.
