

imToken raises cash

Cryptocurrency wallet and blockchain startup imToken has successfully raised \$30m in Series B. <http://dgit.in/Apr21-79>

YouTube tests hiding dislike count

YouTube is testing hiding the public dislike count to prevent online trolls from weaponising it. <http://dgit.in/apr21-80>

Another classic switcheroo

Agent001 issues another PSA for SSD buyers

Agent001 | agent001@digit.in

E

very few months, we'll come across a fresh new way for companies to scam their customers.

It's often interesting to see what new methods they use because more often than not, the companies are doing it without breaking any laws. The only thing being broken here is customer trust. The latest company to go down that road is ADATA, a company that was once the second largest DRAM module manufacturer in the world. And if you have recently purchased their SX8200 Pro or SX8100 M.2 SSDs after reading rave reviews then you're in for a shock.

The company has been switching out the NAND modules for cheaper ones without providing any indication that the internals have changed. ADATA isn't legally doing anything wrong because the official spec sheet is anything but specific. Take the SX8100 for example. ADATA says they're using 3D NAND in the SX8100 which is very much true but what they don't specify is what kind of 3D NAND is being used. The samples from the initial batch that went out to reviewers had TLC (Triple-Level Cell) NAND modules and even the listings on popular ecommerce stores such as Newegg state that they're using TLC

NAND. However, customers who've purchased the SX8100 recently have found QLC NAND inside. QLC NAND can also be built using 3D stacking technology and they're very much 3D NAND.

Unfortunately for ADATA, they didn't scrub all details regarding this switcheroo. The very first spec sheet PDF stored on ADATA's servers, which are publicly avail-

able, specifically state that the XPG Gammix SX8100 has TLC 3D NAND. However, the recently released spec sheet PDFs have had TLC removed from them. Brands change internal components all the time, especially the ones which don't have their own manufacturing facilities and have to rely on external fabs or vendors for their supply. There's also a massive silicon shortage happening right now and it's reported to go on for another year before supply meets demand. Whenever brands do change internal components, they take it upon themselves to match performance so that the end-consumer is still getting what they paid

for. In case matching performance isn't easy, the manufacturers always have an excuse ready – Up to. Yep, if you pick any spec sheet then certain metrics will be rated as 'Up to' indicating a range of performance. This is very much logical since proper performance of a compo-
