

streaming platforms), we depend on advertisers and affiliate earnings. You support us online by either clicking on ads or clicking on Buy Now buttons from our site, once you have decided what to buy.

There's a third way of making money off users, and that is the Facebook way (or any social media way), where they give you little dopamine hits and rewards by allowing people to like or share your comments or posts. What they ask for in return is to divulge as much information about yourself so that they can monetize you better. While Digit shows you an ad online for a new smartphone (because that's who might be advertising

with business accounts, your Instagram likes and activity, and more. All we (Digit) know about you is your IP and the browser you use. They know who your friends are, what you have been conversing about, what brands are [visible in the pictures you have clicked](#)¹, what sites you have visited, keywords spoken in your home (using Google Assistant and Google Home devices) and much more!

SO?

If all the stuff we've talked about above has scared you, or got you enraged, you're probably older than 25, and the more anger you have, the older you probably are. Generation

with us at the moment), you might be there to read the news, or looking to buy a laptop. We can target this, by, say, showing only laptop ads on laptop pages and smartphone ads on smartphone pages, but we cannot target people to the extent that Facebook or Google can.

They have their code running in as many places as they can, so that even when you are visiting us, the Google ads that display on our site are made relevant by the browsing history data that they have on you. Google has this from a myriad of sources such as Google searches, ads, analytics and more... Facebook has this data from your comments, searches on the Facebook platform, WhatsApp chats

Alpha (the successors of Generation Z), are the kids born on or after 2010. They're the ones who are anywhere between 1 and 11 years old right now, and are the ones who will be hitting social media in large numbers very, very soon (if they're not stars on it already). Do you think they care about privacy?

Let's face it, the parents of Gen Alpha kids are mostly Millennials (Gen Y), and these are people who grew up with technology all around them. Most of you reading this magazine are Millennials, and you've been posting baby pictures of your kids and documenting every aspect of their lives for ages now, haven't you? What privacy do they have anyway?

From birth they've been used to seeing themselves on a screen and seeing people react to the cute things they do on videos, and they're becoming better at it than you. When we say "better", we mean surpassing you, not necessarily actually being "better". Because you need your dopamine fix by getting likes on your kids pictures, they're growing up seeking that fix in everything. They're on a TikTok clone or Instagram or whatever, looking for as much attention as people can dish out. In fact, the ability to stand out itself is becoming so hard that they will go to more and more extremes to get noticed.

Gen C will (mostly) be the kids of Gen Z, who are also known as Zoomers. Gen Z are kids who grew up with smartphones in their most formative years, so not only are they internet savvy (like Millennials before them), but they're app savvy and are used to pulling out a phone from their pockets to document everything.

So what on earth makes us believe that Gen C will give two hoots about privacy? They will be the ones watching their mums and dads on TikTok, gyrating to some corny music just to get some eyeballs. YouTube is fast becoming an internet archive of sorts, and unless YouTube starts deleting old videos to make space for the petabytes of new data coming online all the time, Gen C will find everything their parents did online, including the YT comments they made, the Insta stories they shared, and more. And when we say "find" we mean it will all be shoved in their faces by their Zoomer parents, showing off how cool they were "back in the day..."

So no, in my humble opinion, privacy is already dead. It's just a good word to throw about by companies looking to sell you expensive products whose business model is not user data dependent. All of the intrusiveness into lives of technology and the internet that we find shocking today, is going to be the norm tomorrow, and this is something that's always held true. While some of us "old" people are still trying to detox from tech in order to try and form more human connections IRL,
