

Arm's new architecture

Arm's first new architecture has been designed after over a decade for security and AI. <http://digit.in/apr21-65>

Google's Area 120

Google's internal incubator launches Stack - an app powered by Google's DocAI for document analysis. <http://digit.in/apr21-66>

that instances of the word being used rose to a quarter of a million compared to only around 4,000 last year.

LOCKDOWNVERSARY

For most people around the world, March is when everything began shutting down and the now familiar conventions of social distancing, hand sanitising and wearing face masks were first implemented. This time last year, people found themselves stuck at home with plenty of time and toilet paper on their hands. The crazy year that was to be, began with people baking, painting and making things at home, with flour, craft materials and art supplies disappearing from the stores. Almost everyone learned to cook, worked out without gym equipment at home, and very possibly played a game with their friends on a Zoom call. Ludo King saw a spike in usage. Sports fans had nothing but marble racing leagues to bet on for a few months, and that sport had its day in the sun. Most people either picked up a new hobby, or a new language. Upskilling platforms and educational apps saw a rise in popularity, and people began to learn of Massive Open Online Courses. The easiest way to celebrate the lockdownversary is to do any of these things again.

WISH BOARD

There are many names to this thing, which is a pinboard that has a list of stuff you want to achieve including wishes and goals. It is also called a dream board or a vision board. It is supposed to motivate or inspire you into getting done what you want to do in life. Some people think that dreams are lame, and instead use something called an "action board". As far as we can tell, it is just an elaborate bucket list and we are bored.

CYBERLOAFING

This is the practice of appearing to do more work than you really are. There was

already a term that meant the exact same thing, cyberslacking, but here we have another one because a lot of people seem to be doing this while working from home. In offices, every time anyone uses a computer for personal work, or for anything that is not directly contributing to the official work, is a cyberslacker. A more generic term that applies to all kinds of work, not just the work in front of a computer, is goldbricking. The origin of the term is in con artists who would sell bricks coated in gold, making the buyers believe it was a gold brick. It was only later that the buyers would realise that they had not got the value of what they had paid for, and were swindled by the goldbricker. Don't be a goldbricker. There are some simple techniques to make sure that you do not end up cyberloafing. One trick people use is to keep a separate area in the house specifically for work, and not use that space for any personal stuff. Another method involves getting up and getting ready, and "commuting" to work within the house itself, and then doing it the other way around once the hours are done.

DIGITAL WILDFIRE

Digital wildfires are false rumours that spread very quickly on social media, sometimes inciting real world violence. There have been calls for tighter regulation of content on social media platforms that prevents the spread of harmful misinformation, such as loss of reputation because of an unfounded allegation, caused panic over perceived threats and reinforce "groupthink" or undermine the standing of companies, organisations or institutions. For example false rumours of British Army failures in Iraq in 2009. In 2012, a Russian minister tweeted that the Syrian President had been killed or injured, causing a rise in the price of crude oil, till the traders realised that he was

alive and well. If you ask us, the problem here does not seem to be social media, but these digital wildfires are far more damaging than Houseparty stealing your Netflix and Spotify credentials. A World Economic Forum identified digital wildfires as a global risk factor in 2013. Social media platforms primarily depend on the users for self moderation, and although the reporting mechanisms have changed

Shocking images such as these are fodder for digital wildfires. This image was part of a rumour that the Eiffel Tower was on fire.

as a response to digital wildfires, there are no specific mechanisms in place that deal with digital wildfires specifically. As they say, there is sharing and then there is oversharing.

JOMO

Joy of missing out. This one is the opposite of the fear of missing out, and inverts the whole idea of missing out, and makes missing out a pleasurable experience. What you do is miss out on something by taking the time and space in the slow lane, contemplate a totally mundane activity, and give yourself breaks from screen time. Since FOMO makes you spend too much time on social media, JOMO involves reducing the time spent on social media, instant messaging platforms, and using computing devices, and spending more time doing meatspace activities. Don't get us wrong here, JOMO does not prevent you from missing out, you are totally missing out, but that is the great thing about it, you no longer care that you are missing out. **4**
