

One XPlayer

Chinese PC maker One Netbook has been releasing a range of mini-laptops of various shapes and sizes over the course of the past few years. Their latest venture, however, is taking things in a different direction. The One Xplayer is a PC that's shaped like a handheld console. It will feature a touchscreen display in the centre, and have controllers on the sides, like a conventional handheld console. Under the hood you have an Intel Tiger Lake processor. One Netbook has made a device targeted at gamers before, the One Netbook

OneGx1 Pro mini-laptop. The keyword being laptop, this device featured a keyboard, which the One XPlayer does not. The new One XPlayer instead opts for integrated game controllers on the sides which aren't detachable. The One XPlayer is expected to be available in multiple variants, featuring the Intel Core i5-1135G7, Core i7-1165G7, and Core i7-1185G7 processor options. Other specs include an 8.4-inch 1920x1200p touchscreen display, M.2 2280 PCIe NVMe storage and a 60 Wh battery.

Smart Metl

A startup called Smart is using NASA's airless shape memory alloy (SMA) tire technology, which was originally built for use by lunar and Mars rovers, to create a bicycle tire called Metl.

The tires are composed of interconnected springs that don't need inflation. Additionally, the tyres are extremely rugged – built like titanium allegedly – and superelastic, according to Smart's claims. The idea is that the tires will be puncture-free and have no trouble with any kind of terrain, with the additional eco-friendly advantage of no longer needing to ditch rubber tyres whenever they get damaged. SMA tire technology was born when NASA engineers wanted to create a tyre that would be able to flexibly traverse on the lunar and Martian surfaces, one that would retain its shape while also maintaining control. Now Smart, a NASA approved startup, is using the same tech with their Metl tires, which are all set to start shipping out early next year.

Indian eFTR Jr

The Indian eFTR Jr is a miniature version of Indian Motorcycle's America Flat Track championship-winning FTR750. Why miniature? Well, it's been created for kids. Think of this as a starter motorcycle for the younger generation. The eFTR Jr, unlike its inspiration, is an electric offering, also the first ever electric offering from Indian in the 119 years since its establishment.

The motorcycle features two ride modes, low and high. On low mode, the bike can reach speeds of up to 16km/h, and is intended for riders aged 8 or above. The high mode caps the speed at around 24km/h and is intended for riders over the age of 13. The eFTR Jr can support weights of up to 80kg,

and the seat height is 23.2-inches. Like the original, the eFTR Jr features a steel frame with front forks and mono-shock rear suspension, making it suitable for irregular terrain as well. It also

features dual-disc brakes, and while there's info on battery capacity, Indian have mentioned that the motorcycle will have around 140 minutes of juice on low mode.
