

## The largest PS5 in the world

**Y**ouTuber ZHC owns the largest PS5 in the world, which is roughly 100 times bigger than the normal version, which was already pretty big already. Looking at the size of this thing, it probably wouldn't fit in most of our houses, forgot trying to get it through doors. ZHC introduced the roughly 225Kg PS5 on his channel as part of a 100-hour challenge, where he and a team of artists were set to customise the

massive PS5's side panels. Followers of ZHC know that this isn't out of character for him, he's also done a similar challenge with a giant iPhone in the past.

Coming to the PS5 itself, it stands at a whopping 10-feet in height, and costed ZHC \$70,000. Furthermore, the giant console is accompanied by a giant controller as well! And it's not just for show, the PS5 and the controller both work, as a part of the 100-hour challenge, ZHC showcased the controller being used to play games. However, we doubt the controller had any of the new features present in the DualSense controllers. We imagine haptic feedback might cause a mini-earthquake with this controller.

## PS5 VR Controller

**T**he new VR system for the PS5 also unveiled the new PS5 VR controller, which has designed to deliver even more "immersion in VR experiences." The DualSense, which had plenty of issues is still widely considered to be a great upgrade to the DualShock controller, as long as everything works the way it's supposed to. One would expect the same level of innovation in the VR controller as well, and it looks like it's there.

Right off the bat the new PS5 VR controller features a pretty unique design. It uses an "orb" shape, which supposedly allows more freedom of movement and a more natural grip on the controller. Furthermore, the VR controller borrows a lot of features that are present on the new DualSense controllers as well, including the adaptive triggers which can simulate tension and stress, and haptic feedback. Other features include finger touch detection, where the controller can detect where your fingers are on the controller without you needing to press any specific buttons or place them in specific areas.

## Capsule Camera

**W**hile not exactly a new technology, the NHS in England is trialling the use of mini capsule cameras as a diagnostic tool to check for bowel cancer and other gastrointestinal problems in patients. The colon capsule endoscopy can provide a diagnosis in as little as five to eight hours; the best part being that you can go about your life as usual while it's going on instead of being stuck in a hospital for the duration. Additionally, it's a non-intrusive procedure, meaning you won't have to worry about tubes being inserted into your body, it's safe, and like we mentioned above, quick. There's also the issue of traditional endoscopies being considerably more risky with circumstances as they are today, thanks to infection control protocols. Once again, making these capsule cameras a safer, and faster testing alternative, which can be conducted in the safety of your own home no less. Once ingested, the camera takes two photos per second as it passes through your bowel. The information is sent to a recorder in a shoulder bag.
