Claw SHOOT Wireless Gamepad

If you've ever used any of the jack-of-all-trades type controllers, then the Claw Shoot should be right up your alley. It's compatible with Android devices and Windows PCs. It uses the Xbox Controller and is compatible with both Direct Input and X-input on the PC and needs a separate dongle. On Android devices, you can connect using Bluetooth and you will have to use a separate app called Shooting-Plus V3 to ensure compatibility with the different modes and to help with button mapping wherever needed.

The controller works fine on the PC while on Android it could do with a little zeroing on the analog sticks. Most games tend to compensate for slight drift and jitter but Android devices generally don't. Thankfully, the Direct Input mode goes a long way towards helping sort this out. The controller grip has a patch of rubberised coating which helps with the grip and there are motors in each grip to provide tactile feedback. The triggers and the shoulder buttons have the same amount of travel and feel very much like the Xbox controllers so the

familiarity helps. Another thing we'd have fixed is the charging cable which is Micro-USB. A Type-C would have been preferred in this day and age.

SPECIFICATIONS

Poly EagleEye Mini Web Camera

Poly is known for their business solutions for teleconferencing and videoconferencing. With the pandemic, a large part of Poly's target market has been working from home so the company has been coming out with new solutions that are not only pertinent to the average joe but are also compatible with their suite of business solutions. The Poly EagleEye Mini is one such device. It's a 1080p web camera with 1.4x electric zoom and 4x optical zoom that uses a f/2.0 aperture. It's construction gives it a field of view of 74 degrees. The video quality provided by the Poly EagleEye Mini is comparable

with existing solutions in the market such as the Logitech C920 which fall within the same price bracket. However, each has their own specialties. Poly is designed to ensure seamless compatibility with all popular video conferencing solutions whereas Logitech is meant to work well with all sorts of game streaming services. The narrower FoV also means that the Poly EagleEye Mini isn't as great for a large room as other solutions. The other great part about the EagleEye Mini is the versatility of mounting styles that you can have. The detachable camera module is very short but has a nice amount of tilt to it, you then get a flexible extension with support for all popular mounting mechanisms so you can attach it to a tripod, place it flat on a desk, hook it onto a display panel, etc and more.

SPECIFICATIONS
