

DOES THIS SECTION EVEN NEED AN INTRODUCTION? FROM COMPUTERS TO MOBILES, AND HEADPHONES TO GPUS, IT'S ALL HERE...

THIS MONTH IN TECH: This month, we learn about the different types of Active Noise Cancellation, we explore WazirX – an NFT marketplace, we learn how to customise Spotify desktop, and much more.

EU mulling AI ban for surveillance

Leaked regulation plans from the EU show that it is considering banning AI for mass surveillance and social credit scores. The official announcement should happen in the month of May and if adopted will set the EU apart from US and China which currently use AI for similar purposes.

WHAT'S NEW

EU accuses Apple with Antitrust violations over Spotify Case

The European Commission has issued a chargesheet against Apple stating that the company's platform was used to squeeze rival services as they were required to channel their payments via Apple's in-app payment system. The chargesheet comes as a result of a complaint filed by Spotify and is one of the many lawsuits that Apple is fighting against other platforms. The regulators have also stated that Apple "distorted competition" as they laid down guidelines making it difficult for app developers to communicate cheaper payment options. If found guilty, Apple could be fined up to

10 per cent of its annual revenue and even be required to change its business practices. In a press conference,

Margrethe Vestager, who leads the charge of competition enforcement as the European Commission said, "This case is about the central role of app stores in the digital economy. An app store can become a gatekeeper, in particular if there is only one app store available in a mobile ecosystem." <http://dgit.in/AppleEUSpot>

FBI thwarts plan to kill 70 per cent of the Internet

The FBI have arrested a would-be-bomber who wanted to blow up several Amazon Web Services facilities with the aim of taking out 70 per cent of the Internet. The FBI got wind of the Texan man's plans to blow up an AWS data centre on Smith Switch Road in Ashburn, Virginia when he elaborated his plans on the website MyMilitia using the handle 'Dionysus'. The criminal was planning to use C-4 plastic explosives to attack

Amazon's data centres. He was arrested when he met an undercover agent to procure the

explosives. The criminal believed that there are 24 AWS buildings which run 70 per cent of the world's Internet. He believed

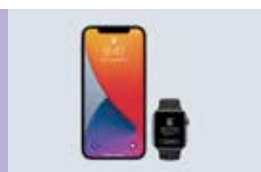

that these buildings housed servers that were used by the FBI, CIA and other security agencies and these agencies had engaged in an 8 billion dollar annual contract for the services. If found guilty, the would-be-attacker faces up to 20 years in prison. While AWS does host a lot of web sites on their servers, there are multiple redundancies built-in which would have made his attack pointless.

China fines Alibaba \$2.8 billion

China fined Alibaba 18.2 billion yuan or 2.8 billion USD after the country's antitrust regulators found the company to be behaving like a monopoly. Investigation revealed exclusive agreements preventing merchants from selling products on rival e-commerce platforms. <http://dgit.in/AlibabaMonopoly>

iOS 14.5 is out now with new features

Apple has brought out iOS 14.5 which hosts several new features. These features include the ability to unlock an iPhone using Apple Watch, additional Siri voices, skin tone options for emojis, several new stringent privacy controls and more. <http://dgit.in/iOS145>

NVIDIA to launch RTX 3080 Ti?

A few rumours have been pointing to a new flagship launch from NVIDIA to rival AMD's RX 6800 XT GPU. The new card could be named the RTX 3080 Ti and will supposedly be based on the GA102 GPU and might come with 12 GB of GDDR6X VRAM. <http://dgit.in/3080TiLeak>
