

Mylio syncing

The editing interface on the computer

except for the places where you want to backup all the photos. For some users, a single backup vault may be enough.

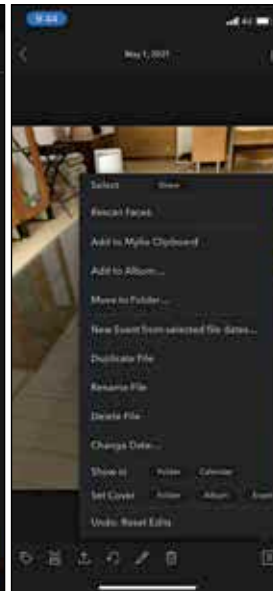

SYNC FROM YOUR DEVICES

To transfer the photos from your mobile device to a computer or a vault, and then to delete the photos from the device, click on the icon with the three vertical dots on the top right of the interface and go to Settings. Then, select "Free up space on the device", and hit continue. The software uses the date to backup photos older than a month. Hit Continue. If you have gone through the previous step in the tutorial, then all the photos that can be safely deleted from the device are displayed. If you have a good data plan, make sure that the toggle to sync over cellular networks is enabled in the settings. By default, the app will remind you to repeat the process every month.

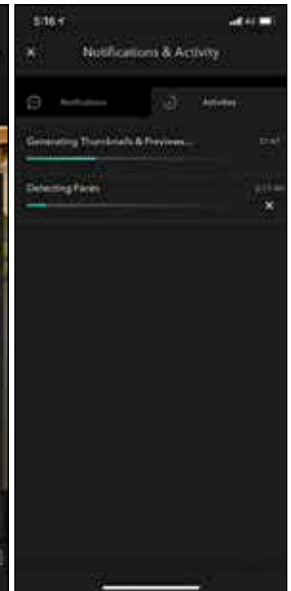

Now, it does not matter what kind of device you use, just plug it into the computer where you are using Mylio, and the software will automatically show a prompt if it detects images taken from a camera. Mylio uses the exif data to do a lot of its magic, such as automatically organising the photos by date and location, as well as by camera manufacturer, model and lens.

Free up space from your phone

Editing on the smartphone

Face detection of the photos is turned on by default.

EDITING PHOTOS

Mylio uses XMP for saving the edit information on a separate file, which will be familiar to those using Lightroom. This means that you can edit a file on the phone and continue editing the same file on the computer, or create a preset and apply the same edits to multiple files. Note that the batch editing capabilities are not that advanced. Just long press on the

image to edit it on the phone. On the computer, the option is available on the right panel. Click on the image, select the Edit tab, and then click the Edit Photo button. The brilliant thing about this is that the handoff between the apps is entirely in the background and invisible. All edits are saved with the photo itself and can be reset at any time from any of the connected devices. **4**
