experience. In order to set up a theme, Spicetify uses two files, a color.ini file and a user.css file. The color.ini file is what configures colour options on the client, while the user.css file is used for all the additional options that Spicetify is capable of injecting into Spotify's UI. If you're familiar with CSS and editing ini files, you can try your hand at creating your own theme, however, even if you don't, there's already a sizable library of great looking themes you can check out and download here: <https://github.com/morpheus-thewhite/spicetify-themes>.

You can go ahead and download the entire repository if you wish, or find the one theme you like and download just that. Note that what you need is just the color.ini and user.css files of these themes, and you could just create these files yourself

as well. We'll go through both the ways you can go about this.

Once you've identified a theme you want to use, in our case, we went with BurntSienna, you'll want to drag and drop the BurntSienna folder from the repository you downloaded into the Themes folder in the .spicetify folder in C:\Users\YOURUSERNAME\. Alternatively, you can create a new folder inside the Themes folder with the name

of your theme and here you will need to create a color.ini and user.css file. To do this, you can simply open the theme's (in this case, BurntSienna) color.ini and user.css files in notepad if you've downloaded them and copy the text into your own created color.ini and user.css notepad text files. Save these files in the new folder you created. You can

copy this text directly off of the GitHub repository as well, without needing to download it. Make sure that the extensions are correct, i.e., .ini and .css, it won't work if they're still .txt files. Also note that some themes might require you to download certain fonts.

Now comes the final step, activating the theme, simply input the following command in Powershell:

```
spicetify config current_theme = BurntSienna
```

Replace BurntSienna with the name of whatever theme it is you're using. Then, run the command

```
spicetify apply
```

Spotify should restart with the new theme applied. If this doesn't work, you can head over to the .spicetify folder and find the config.ini file. Open it with notepad or your text editor of choice and find "current_theme = ". Add the name of your theme here after the = and run the spicetify apply command again. Spotify should restart with your new theme applied.
