

OBSBOT Me

Funding: \$231,469 pledged of \$50,037 goal

Link: <http://dgit.in/obsbotme>

The OBSBOT Me is an AI phone mount that can track the subject that you're attempting to shoot or record. This is a pretty handy feature for someone who doesn't have anyone around to help with shooting videos. Furthermore, the OBSBOT Me is compact and foldable, making it easy to carry around for those who like to shoot videos on the go. The creators of OBSBOT Me claim that the device uses an advanced neural network to achieve AI tracking, something they claim is always stable and smooth when it comes to tracking. OBSBOT Me is what one would call a 'set and forget' device, because it attempts to do away with needing to constantly adjust your camera or phone. To that end, OBSBOT Me responds to simple gesture commands, simply raising one hand up should be enough for OBSBOT Me to recognise and

start tracking. The OBSBOT Me has a wide-angle camera and AI image processor built into it to help with tracking; it needs no additional apps or Bluetooth connection to do so. This is significant because it means that you're not bound to any single app and can record through anything. Keep in mind that the OBSBOT Me itself cannot be used to record footage, the device's camera is purely for tracking. OBSBOT Me features a universal joint and rotatable holder, you can adjust this device pretty much as you please.

Fingerbot Plus

Funding: \$55,145 pledged of \$20,000 goal

Link: <http://dgit.in/fingerbot>

Today, it's possible to have a completely smart home, with everything from doors to curtains being smart. However, a fully smart home can be quite expensive. There's also still things for which the smart solution isn't feasible yet, or hasn't been figured out yet. Turning your home into a smart home means replacing your normal utilities with smart ones. However, with Fingerbot Plus, there's another way you can go about this. Most traditional houses and devices use buttons and switches. Fingerbot Plus is essentially a smart finger that'll do the button pressing for you. As long as it has a button that's required to operate it, you can turn it into a smart device with Fingerbot Plus. This solution is significantly cheaper than buying a smart variant of the same device. Fingerbot Plus has been designed to work easily with traditional buttons and switches in order to easily trigger them. It also comes with its own adhesive to stick it to surfaces. Like with any smart device, you can program it to work as and when you want it to; set it on a schedule or set it to loop over a fixed period of time using the accompanying app. Plus it integrates well with whatever smart home system or smart assistant you're currently using. Check Fingerbot Plus out on Kickstarter if you're interested in a budget method of going smart.

DropKey

Funding: \$196,169 pledged of \$25,000 goal

Link: <http://dgit.in/dropkey>

DropKey is a pop-up studio with lighting and greenscreen that you can easily carry around with you. There's no denying that video is the most popular (and most consumed) form of media in the world, so there's a need for solutions to improve video quality that don't exactly burn a hole through your wallet. DropKey attempts to provide that solution with an inflatable, portable, green-screen studio. Paired with its own app, the creators of DropKey claim that you can create Hol-

lywood studio grade shots, anytime and anywhere. When deflated, DropKey is about the size of a travel bag, and using a blowing machine, in about a minute DropKey can be inflated into a sizable mini green-screen studio. The DropKey

mobile app comes free with the DropKey pop-up studio, and is essentially a camera application for iOS and Android. It also comes with a lighting controller and audio mixer system, which means you can use the app with lighting devices and more as well. The app pairs with the pop-up

studio via Wi-Fi. According to the creators of DropKey, they're also the world's first wireless audio and lighting controller that can be controlled right from the DropKey camera display screen. You can check out DropKey on Kickstarter.
