

FIGHTING CHANCES

Meet the companies and people who are saving lives

As India began to brace for the pandemic early last year, there was a demand for economical but effective medical equipment and protective gear. Local manufacturers had to step up production to deliver these in time. The Covid 19 challenge by the government, as well as a call for self reliance got a response from engineers, researchers, entrepreneurs and startups. Companies that had expertise in manufacturing textiles or anti pollution filters pivoted to making gear for the pandemic. The incubators at the IITs became hubs of innovation, with startups coming out with novel solutions to address the outbreak. These included apps for contact tracing, disinfection robots, long range infrared thermometers, face shields, antiviral coatings and low cost reusable PPE kits.
