

NANOTECH RESPIRATORS

These are state of the art respirators made in India, and use nanotechnology to keep you and others around you safe.

Swasa:

E-Spin nanotech spun out a website just for the Swasa mask, which has seen a high uptick in demand after being used by the Prime Minister.

Nasomask:

The more interesting product are the Nasofilters, disposable and biodegradable stickers on the nostrils that keep particles out, and still allow you to eat!

humans from air pollution to develop their own respirators, supplying to the local market, and then quickly exporting to countries where they were in demand. Sharma says, “We have expertise in providing affordable products for air pollution problems but then COVID came and changed the market entirely. Our product Nasomask which was introduced in the market during Diwali 2019 as an effective and affordable N95 grade face mask became the need of the hour during the pandemic. We served our nation by prioritising our sales to hospitals, health care centres and Government authorities, as they were at a higher risk. We also exported lakhs of Nasomasks to countries like China, Thailand, UAE. We were into facemask business even before the pandemic started which helped us in accelerating in a very less time.”

On scaling the manufacturing during the various restrictions to address the pandemic, Sharma says, “Nanoclean has successfully established a mask manufacturing setup with the support of TDB (Technology Development Board) & DST’s (Department of Science & Technology) Cawach Scheme. We have a production capacity of 20k N95 grade masks per day. Our major production is consumed by Hospitals and Airport staff. Our production facility is also granted with BIS certification mark license which is itself a hallmark of great quality.”

The masks were so effective because of the extremely tiny fibres used in the nanoscale filters, which are more suitable for trapping aerosols. Sharma explains, “we are using nanofiber technology to make highly efficient filter media for our products. Fibers of our filters have 100 times smaller diameter than thread of a normal fabric. We have millions of more pores on a unit area as compared to normal fabric thus our filters have higher breathability.” That means that even though the masks are very good at filtering aerosols, they are not uncomfortable to wear for long periods of time, and put almost as much pressure on the lungs as not wearing a mask at all.

Commenting on the problems faced in India, Sharma says “the root cause of everything was lack of supply. To address this, we are coming up with India’s largest GOI funded N95 mask production plant. Nasomasks stands for its efficiency, quality and promoting the idea of Atma Nirbhar Bharat.” We can expect more announcements from the company, Sharma says “Making new and innovative products is our identity. So, you can expect some exceptional products in the year 2021.”

It was only in June 2020 that the WHO updated its guidelines for the use of masks during the pandemic, advising everyone to wear masks to prevent community transmission of the virus. It had previously advised

wearing of medical face masks only for those who were sick from the disease, or the healthcare professionals working with COVID-19 patients. By then Maharashtra, Chandigarh, Uttar Pradesh and Odisha were some of the states that had made wearing of face masks mandatory in public. It became clear that it was necessary to keep prompting or nudging people into wearing masks. Swasa responded with a fresh new fashionable line, with prints that were appealing to the youth. The masks keep getting sold out on the site. In September 2020, Nirvana Being introduced stylish face masks that could be washed up to ten times. These Airific 2.0 masks are soft and flexible, and feature pop culture figures from Disney, Marvel and Star Wars.

Jai Dhar Gupta, Founder and CEO of Nirvana Being says, “With the coronavirus spreading like wildfire, we at Nirvana Being wish for massive adoption of mask wearing behaviour with masks that people actually enjoy wearing. And to achieve that, we have come up with masks for the discerning eye which are both functional and aesthetically pleasing to make it a fashion-forward accessory. Design has become an important factor in our lives as a way to cope in the new reality that we live in and the pandemic has brought out a lot of authentic self-expression in people. With the Airific 2.0, we are giving people a chance to wear their personalities.”
