

Apple extorted

Hackers try to extort Apple after stealing files from company that makes its products. <http://digit.in/may21-41>

We could build Jurassic park?

Neuralink co-founder Max Hodak claims that humans have the technology to recreate Jurassic Park. <http://digit.in/may21-42>

Time zone

The GMT complication was a subdial that showed the Greenwich Mean Time, used by pilots and shipmen, and later adopted by frequent travellers to show the time in their home towns. Some variants use a second hand to indicate the time in another time zone, which can be for a disc on the bezel, which can be turned to change the time zone. World Time watches use a rotating 24 hour disc combined with a 24 hour bezel to simultaneously tell the time everywhere.

Minute repeater

The minute repeater was a complication used by the blind to acoustically indicate the time at the push of a button. Shown above is the Zeitwerk minute repeater, which actually has visible chimers in the form of those odd shaped horns on the left and right side of the dial. These are a pair of tiny hammers, the left being a ding and the right being a dong, which together chime out the time on demand by indicating the hours, quarters and minutes through a series of rings.

Day date

A triple calendar watch indicates the day, date and month, but each of these is considered to be a unique complication. A common and simple complication on a watch is the date, which is typically indicated through an aperture on the dial, at times digitally. These watches may require additional effort by the wearers to keep them in sync with reality, such as manually resetting the dial for the date at the end of 30 day months. More expensive models keep time for longer.

Supercomplication

While there is no authority to decide it, it is generally accepted that a watch with at least one astronomical complication, one timing complication and one chiming complication is given the tag grande complication. A number of watchmakers have outdone themselves trying to fit larger numbers of complications onto a single watch. The Patek Philippe Calibre 89 has 33 complications while the Vacheron Constantin Reference 57260 has 57. The complications are mostly calendars, showing various dates and times of astrological or religious significance.

Cinema

The Russian Watchmaker Konstantin Chaykin has come up with a watch that uses the same principles as the zoopraxiscope to display a full blown animation, on demand, on the dial. The mechanism is very similar to a regular watch actually, a dial with the images on it rotates at the speed of 1 frame per 0.07 second. The movie can be customised on order, but the default comes with the first movie ever shot, that of the horse running, shot by Eadweard Muybridge.

ABC

ABC watches have three complications that are useful to the adventure sports community, altimeter, barometer and compass. Many of these watches have a thermometer as well, and these functions are typically indicated digitally. ABC watches are especially geared to be shockproof, waterproof, dustproof, hardy, and generally work in all kinds of weather conditions. Companies specialising in smartwatches and fitness trackers have begun making ABC watches now.
