

Cardlax

It's an issue that plagues a lot of us, but most of us are too embarrassed to even admit it. Ear wax, more importantly, ear wax caking up inside our earphones. That's where Cardlax comes in. Cardlax is basically a mini washing machine for your earphones. Don't worry, there's no water involved and your earphones will make it out just fine, more than fine even. The mini washing machine is like a tiny box that can easily sit in a corner of your desk. To use it, simply pop the lid open, which will reveal a small spinning brush.

This brush is used to dislodge chunks of dirt off the earbud and also clean out crevices and harder to reach areas. This is just the pre-wash, the next step is dropping the buds into a cleaning drum, the kind that spins, you know, like a real washing machine. This drum has a spinning core that's made out of a lightweight foam and 70% alcohol misting. In here, the buds rub against this foam and finer particles are removed.

Futurecraft.Strung

Adidas is all set to release a new sneaker design, one that has a 3D-printed sole and fabric upper that's woven by a robot. The weave uses as many as 10 different yarns. Strung, which has been designed at Adidas' Futurecraft lab, is a demonstration of how for the first time, single threads can be programmed in any direction, with each thread having different properties and strength. The end result is what can only be described as string art. Almost seems like a shame that you would need to put your feet into them. The robots that Adidas uses weave the fibres and yarns in intricate and complex patterns, and these can be customised as well. Also, since it's being made by robots, the time to create a pair of sneakers is as short as an hour and a half, which they plan to cut down to minutes in the coming months.

gammaCore

The gammaCore is a handheld device that can relieve pain by delivering low-level electrical currents. It sends electrical currents when held against your neck which can block pain signals. This has been found to work for people with cluster headaches, which can last for between 15 minutes to 3 hours and can occur as many as eight times a day. Using the gammaCore regularly reportedly helps relieve the headaches and prevents onset headaches from happening as well. It was found to be effective even on patients who did not respond to treatment methods like painkillers and oxygen. The gammaCore was all set to release in 2019 but was delayed due to the ongoing pandemic. These small devices could make a huge difference for those who frequently suffer from headaches and are finding painkillers less effective over the years.
