Fossil Gen 5E Smartwatch

The year hasn't been great for anyone and hardware manufacturers have become cognizant of their consumers' shifting buying behaviour. Folks are being more prudent with their purchases and smartwatch manufacturers have been releasing budget devices. We saw Huami come out with their Amazfit GTR 2e variant last month and now Fossil has come out with the Fossil Gen 5E variant. The 'E' in both models could very well stand for 'Economical' as both devices fall within the sub-₹10K segment. Like with the Amazfit GTR 2e, the Fossil Gen 5E also cuts down on several features. It uses the

Snapdragon Wear 3100 platform and has scaled down on the RAM from 8GB to 4GB. The GPS is also tethered rather than being built-in. WearOS on the other hand has evolved a bit over the last year and we now have native sleep-tracking and the general usability of the smaller interface has gotten much better. Fossil has also been working on several improvements, the improved battery modes make the device last much longer, the addition of the cardiogram is much welcome but it's a little slow to pick up your heart rate. You can blame the

form factor for that. Lastly, the overall UI improvements with WearOS have also helped a lot.

SPECIFICATIONS

SOC: Qualcomm Snapdragon Wear 3100 | **OS:** Google Wear OS | **SUPPORTED OS:** Android 6.0+ (excluding Go edition) and iOS 12.0+ | **STORAGE:** 4 GB | **RAM:** 1 GB | **GPS:** Tethered | **BATTERY:** 300 mAh | **SENSORS:** Heart Rate, Accelerometer, Gyroscope | **INTEGRATED SPEAKER** | **PRICE:** ₹18,495

ASUS TUF Gaming CU4K30 Capture Card

Everyone wants a piece of the video game streaming market and ASUS is the latest hardware company to foray into the space with their external capture card – ASUS TUF Gaming CU4K30 Capture Card. The CU4K30 is quite compact and has a metal body with a metallic grey-black two tone aesthetic. The front has two 3.5mm audio jacks whereas the display and USB 3.2 Type-C interfaces are on the back. They also provide an RGB lighting strip on the front which acts as an

indicator for various functions. The great part of the ASUS TUF Gaming CU4K30 is that it can capture 1080p@240Hz displays which makes it great for eSports and on the other end of the spectrum, you can also capture 4K@30Hz so it goes well with the current gen consoles that are all geared for 4K. The passthrough allows up to 4K@60Hz which was a conscious decision by ASUS so as to not add any latency on the video stream channeled via the capture device. 4K capture devices tend to get a little hot over time and ASUS has used a fanless design for the device which surprisingly does well even after streaming 4K for more than an hour.
