

Transparent TV - Coming to a home near you

gling with the mass adoption of 8K and the struggle for 8K content is even greater. While cost is a major factor for this, 8K doesn't seem feasible for the foreseeable future. So if you were thinking of enjoying content in 32K in the year 2041, we'd say, you need to rein in your expectations.

6. The full-colour gamut

The one place we think massive advancements will be made in the coming decades is with the colour gamut displays can represent and a lot of this will have to do with the backlighting we discussed above. Today's flagship TVs don't even cover 80 per cent of the Rec2020 colour space. OLED TVs are the ones that can currently display 70-to-75 per cent of the Rec2020 colour space and a lot of that has to do with the OLED backlighting. Some of the TV technologies slated to hit in the next decade have the capability to show 90 per cent and more of the rec2020 colour space, and that will definitely add to the immersion.

7. Transparent TV

At CES 2020 we got to see the concept of a transparent TV from the likes of Panasonic and Skyworth. These were of course prototypes and their real-world use was limited. But imagine the possibilities of a transparent piece of glass in your living room or wall coming to life to entertain you. Your window could double up as your TV! Now that's something straight out of a sci-fi movie and it could very well be in your home in the next decade.

8. Rollable TV

Rollable TVs were a concept until LG finally launched them for a whopping ₹65,00,000 in 2020. And while it's still out of reach for most consumers, LG's launch of a rollable OLED is proof that a concept can become a reality, even if it takes a decade. Today we are looking at TV technology two decades in the future. Needless to say, it is possible that an OLED panel will roll down in your entertainment room instead of a projector screen in the coming decades.

9. Modular TVs

Have a 55-inch TV today and want a 75-inch TV tomorrow? What's the point of selling your TV and buying a new one when you can simply add more modules and make it a larger TV? Samsung has already introduced us to The Wall, its modular micro LED TV and at CES 2020, it showed off a 292-inch Wall made up of micro-

LED panels. Yes, modular TVs are a reality today, but they have some caveats. We could see the upgrade cycle for TVs change in the coming decades where a user will simply add or remove panels to change the size and features of the TV. It would definitely make bringing a large screen TV home easier.

10. Foldable TV

If a modular TV and a rollable TV had a lovechild, it would undoubtedly be a foldable TV. Bad jokes aside, we have seen the C SEED M1 - the world's first foldable 165-inch MicroLED TV. In this TV, different panels unfold and join to offer the viewer 165-inch home theatre goodness. Considering the space-saving nature of modern architecture, foldable TVs may be around the corner in the coming decades as a more viable option for those looking for a large screen TV, but also want to smartly utilise the space in their house.

11. Two people watching different shows on the same TV

Back in 2011, Sony launched a 24-inch 3D monitor that let two people see different images on the same screen sitting at different angles for a better multiplayer experience. It's hard to sneak up on a friend when he can see you on the same screen, right? While the monitor was great, the technology never really caught on. And while PIP is possible in today's TVs so that two people can watch different pieces of content the experience isn't immer-

LG rollable TV - A magic trick and a TV 'rolled' into one
