

14. Wristwatch TVs

In 1983, James Bond used the first watch with a built-in TV screen. While the one used in the movie Octopussy was a prototype, Seiko did sell a TV watch in the market. But it looks like the technology wasn't right for its time. With today's smart-watches sporting OLED displays and the ability to show you photos you've clicked, would it be too far fetched for TV watching on a smartwatch to make a comeback? It would be the perfect companion for streaming addicts on the go!

15. The TV will know exactly what you want to watch

Coming closer to reality, this one isn't too far fetched - the TV will know exactly what you want to watch. Services like Netflix and YouTube already recommend content based on your interest. Smart TVs also recognise phrases such as "Play a comedy show" or "I'm looking for an Action Movie". Commanding a smart TV is more like requesting a video vendor for the latest movie rather than commanding a piece of technology.

16. The absence of the screen completely

Just think about it, what if there was no screen, no black mirror on the wall? Remember the movie, Minority Report where Tom Cruise watches the video of his son as a hologram image? Imagine a future where holographic projectors are the new form of home entertainment adding a whole new level of immersion. Holographics TVs have been in existence since 2013, their commercial viability is expected to increase by 2026. This means we can see truly immersive 3D images in our rooms without resorting to a TV and clunky glasses.

17. Being a part of the entertainment experience

While a 3D hologram sounds exciting, what's even more exciting is physically being in the movie. We've seen tech demos of these using a VR headset and Sony's upcoming second-generation PSVR headset could add to the immersion thanks to its haptic

feedback and adaptive triggers controller. We've also experienced 4DX in theatres in India where the seat shakes to simulate the action screen along with very realistic rain effects. But the same hasn't been replicated in the home. Not yet anyway.

18. The dominant TV OS

The majority of smart TVs in India run on Android TV. But it isn't alone. Xiaomi has its own PatchWall UI based on Android running on Mi TVs, LG has WebOS and Samsung has Tizen. We also have a handful of

While the DisplayPort hasn't become popular on TVs, HDMI has remained the go-to connection option for TVs today. It is used for both audio and video signals. With the new HDMI 2.1 standard, TVs can support a data transfer rate of 48 Gbps. For comparison, HDMI 2.0 had data transfer speeds of 18 Gbps. With HDMI 2.1 users can consume content in 4K at 120 Hz or 8K at 60 Hz. Users can also get Dolby Atmos sound at full resolution thanks to HDMI 2.1, something that wasn't possible over HDMI 2.0. Needless to say, it looks like HDMI

Samsung 'The Wall' MicroLED TV

TVs running on the Fire TV UI. But it's safe to say that Android is the most dominant smart TV OS. However, it looks like that will change in the future. LG has already announced that it will licence its WebOS to other TV makers, increasing the market share of LG's OS. With more and more TVs opting to offer a unique smart TV experience, it won't be long before we see more TV come with a unique smart TV experience tailored for the viewer.

19. One port to rule them all

If you have a good old DVD player, chances are your brand new TV no longer has the trusted red, white and yellow AV port. Instead, there is a 3.5mm port that may look like a headphones jack but is a port where you can connect an AV adapter.

is here to stay for the next decade at least and considering how new the HDMI 2.1 standard is, we can't wait to see how this technology evolves over the next two decades.

20. The Retina TV

Let's close this list with something staring out of the fictional dark reality of technology - Black Mirror. Episode three of Season one is a brilliant example of what it would be like to have a TV implanted directly in your eye. Yes, while the episode involves a man replaying the events of evening dinner, imagine just sitting there, staring into nothingness, but in reality, catching up on your favourite movie without anyone knowing what you are watching. It could be a more personal and immersive experience than strapping on a VR headset.
