

Ghost of Tsushima is a very good looking game

Multiplayer Online (MMOs) games like World of Warcraft.

We’ve also seen a staggering improvement in video game graphics over the years, approaching the point where it’s hard to tell some games apart from movies at this point. Gaming hardware is still improving and becoming more powerful and efficient every generation, offering significantly better performance and quality with each iteration.

In the past five or so years however, one particular segment of the video game industry has grown rapidly, to the point where it has surpassed every other segment of gaming. We are, of course, talking about mobile gaming. The explosion in mobile technology post 2007 also saw a similar explosion in mobile gaming, which in turn brought gaming to the mainstream in a way never seen before. Millions of new gamers, especially from Southeast Asia, would pick up gaming for the first time. Countries where owning a gaming PC or console wasn’t feasible could now simply play games on their mobile phones, which were getting more powerful by the year. The mobile industry doesn’t look like it’s slowing down anytime soon, which means that mobile gaming is only going to get better as mobile game devs get access to more powerful tools and hardware. We’re already at a stage where mobile games can provide an experience that’s almost as good as a console or PC, such as with games like PUBG Mobile and Gen-

shin Impact. In the coming future, we might even have the same graphics on mobile, and much much more.

GAMING IN THE FUTURE

By much much more, we mean that there are plenty of avenues where gaming can grow. If there’s any kind of innovation in technology when it comes to entertainment, be it the way we create new entertainment experiences, or the hardware that we use to consume entertainment, you can bet that gaming will be at the forefront of it all. Ultimately, gaming is a beast that adapts and evolves, as new tech and forms of entertainment emerge, gaming will change; it’s not going anywhere anytime soon. To that end, we certainly have some big and exciting things brewing for the future of gaming.

Consoles and the ‘Console Wars’

The PS5 and the Xbox Series X and S are fresh on the market right now, and they’re amazing pieces of hardware, but it’s very possible that these could be the last mainstream consoles that we game on. We can’t know for sure if consoles as a whole will go away for sure, but what we can say is that the ‘console wars’ as we know it will come to an end. Microsoft and Sony are definitely moving on to bigger things, things we’ll talk about later in this article. We can already see signs of Sony’s walled garden crumbling, with them finally deciding to bring a lot of their console exclusives to PC as well. Microsoft and Xbox have already made it clear that they want an inclusive gaming ecosystem, they did away with their console exclusives a while ago, and have already taken steps to make games a lot more accessible to the masses with their Xbox Games Pass which has seen a lot of success. Mobile gaming has already replaced handheld consoles, although the Nintendo Switch is still going strong. This in large part has to do with the unique experience it offers, being able to freely switch between a full-fledged console and a handheld is still something that’s unique in the market. Speaking of Nintendo, they might be the only ones unphased – at least for a while – and will most likely continue to

Microsoft vs Sony, who will win the latest round?
