

Retron Sq

The Hyperkin Retron Sq is a standalone console that allows you to play GameBoy (and GBA) games on the large screen. Introduced initially as a prank back in 2017, Hyperkin didn't realise that there would actually be demand for a console that let you play GameBoy games on a large screen. It was then revealed at CES 2020 as an actual product, and it is now officially available. It's quite simple to use, you will however, still need a gameboy cartridge to use the console. Plop the cartridge in, power it up, and play. That's it. Of course don't forget to connect it to a display,

using the HDMI port that's present behind the Retron Sq. Unfortunately, the console offers no customisability, which makes it difficult to work with or access the console's emulator settings. On the back you also have a removable microSD card, this is where the console's software is stored. There's also a USB-C port here for power, and an aspect ratio toggle switch between 4:3 and 16:9. The console comes with its own matching controller as well, modeled after the SNES gamepad, with a 10-foot long cable.

World's smallest single-chip system

Researchers at Columbia Engineering report that they have built the world's smallest single-chip system, which has a total volume of less than 0.1mm^3 . This means that the entirety of the chip system is as small as a dust mite and can only be seen under a microscope. The team used ultrasound to both power and communicate with the device wirelessly. Ken Shepard, lead of the study, said that the goal was to see how far they could push the limits on how small a functioning chip they could make. The result is something that could revolutionise the development of wireless, implantable medical devices. The design for the chip was done by Chen Shi, a doctoral student. The design is unique in that the chip's function depends on the volume. Usually it would be impossible for devices this small to function because of the wavelength of electromagnetic waves being too large. Ultrasound waves on the other hand are much smaller, because sound is slower than light, therefore making communication with the device possible, and wireless.

OnePlus Cyberpunk 2077 watch

OnePlus has announced a special edition for its OnePlus Watch, in collaboration with CD Projekt Red. The Limited Edition Cyberpunk 2077 OnePlus Watch will feature the neon yellow and black accents that we've come to associate with CD Projekt Red's latest title. The watch will feature a bunch of custom new faces featuring the colours of Cyberpunk 2077 such as neon cyan, red, yellow etc. The watch will also feature custom boot and charge animations. In terms of specs, this will be the same as the standard

OnePlus Watch, with a 1.39-inch AMOLED display, a 402mAh battery, SpO2 and heart rate sensors, 5 ATM water resistance and more. The limited, special edition is expected to cost quite a bit more than the standard edition and is expected to be limited only to China. This would be in line with the Cyberpunk OnePlus 8T model which was also limited only to China. Unfortunately, the watch itself isn't too great, which ironically applies to the game as well; maybe there might be those who are interested in the collaboration though.
