

Redmi Watch GPS

We recently got our hands on the Redmi Watch, the latest smartwatch from Xiaomi in India, after the recent Mi Watch Revolve that launched earlier this year. Comfortably in the budget segment, the Redmi Watch comes with a simple design and as expected at this price range doesn't come with certain premium features like screen protection and swappable straps. However, the display itself is quite bright and clear, even in daylight, there are little to no issues when it comes to reading the watch. The Redmi Watch, like most smartwatches, comes with a bunch of tracking features, including an in-built GPS and a heart rate monitor. However, the watch does not have an included SpO2 monitor. Other than

that, the watch supports up to 11 sports modes. The Watch's software is simple and plain, it has no fancy animations or graphics, and overall has a very minimalistic aesthetic. This minimalistic aesthetic applies to the entire body of the watch itself as well. This is ultimately subjective. The watch has only the most basic of features, which is to be expected at its price range, but it does them without any issues. As for the battery, the

Redmi Watch can go pretty long, in our case, at least a week with moderate use without needing to be charged, so it definitely has that in its favour. The watch can also track your sleep, and does a fairly decent job at it. Overall, this is a decent pickup if you're on the lookout for a budget smartwatch with some tracking features, however, for slightly more you could get your hands on more feature-rich smartwatches.

Syska Accessories P2024J Power Bank

Syska has recently come out with a 20,000mAh and 10,000mAh powerbanks, and we've got our hands on the former. The only difference between the two is the capacity, with their features and design being otherwise the same. The Syska P2024J Power Bank comes with 18W fast charging and quick charge 3.0. Inside the box, you get the power bank itself, the user manual and warranty card, and a small type-C USB cable. Right off the bat, the power bank looks pretty nice with its metal body and its dark blue colour (review unit). The power bank also has black and red colour variants. The power bank's body is pretty big, and weighs almost half a kg, which is to be expected with a full metal body. This, of course, also means that the power bank is pretty sturdy and durable. The 10,000mAh variant is comparatively more compact. Coming to connectivity, you've got all the ports on one end of the power bank,

these include two fast-charging USB out ports with (5A-3A / 9V-2A / 12V/1.5A) charging support. One of these is coloured orange to show 18W Qualcomm Quick Charge 3.0 support, if you have devices that can take advantage of that. For input, we have a Type-C USB port with 18W (5A-3A / 9V-2A / 12V/1.5A). This port supports both input and output. There's also a microUSB input which supports fast charging. Just above these ports are four LED indicators which show the remaining battery in the power bank. The first LED glows red when the power bank is charging, otherwise they glow white. We can say for sure that the fast charging

works, maybe not 100 per cent as advertised but that is never the case with power banks. It's still very much satisfactory, and we were able to fully charge a device that supports 18W fast charging in roughly 2 hours 40 minutes. Plus, the power bank is fairly affordable.
