The next 20 years for routers technology

them to reinvent themselves to achieve success in the B2C market.

Consumer needs change over time as a result of knowledge upgradation, priorities, and technological improvements. One common trend is the need for convenience. Businesses have had to alter new or existing products to suit the customer's need.

Modern consumers always carry an endless source of real-time information in their pockets ie. their smartphones. This is "real-time information predicts potential buyers will always find the best deal available in a real-time scenario.

The future is not just somewhere we dive into, but is something that we create. This means that institutions, organisations and individuals play an active part in determining the direction of consumers through their actions and choices. The pace of consumer behaviour change has already shifted gears, and we will see the most dramatic transformation of how consumers make their purchases. Social media is already causing a global paradigm shift, influencing people's habits and behaviour using the latest technological advancements.

Consumer behaviour could be influenced by multiple aspects including personal preferences, economic conditions, purchasing power, socio-cultural groups. All these factors contribute majorly towards a consumer's behaviour, and the characteristics that define a customer will change as her/his life changes. The consumers would adapt according to these factors which would bring about a change in their buying decisions.

We are looking towards tremendous growth in the fields of Internet of Things (IoT) devices and business networking, which helps customers embrace the trends of connecting

almost everything. We believe the combination of advanced technology and continual innovation in every iteration will contribute to a smart future.

IoT comprises objects, often electronics and sensors, that are identifiable and can communicate with each other and exchange data via the Internet and cloud solutions. The Internet and mobile phones initially were used to just let people communicate with each other at any time and place, but now seemingly almost every object is part of this combination. With the emergence of the Internet of Things, it is possible for anything, like light bulbs and cars, to be connected to a network and exchange data. IoT is opening the door to opportunities that entail more than just the improvement and digitalisation of individual processes.

TP-Link has developed WiFi 6E devices with an additional 6 GHz band. WiFi 6E works with the same standard as WiFi 6 but with an extended spectrum, 6 GHz is the new frequency band ranging from 5.925 GHz to 7.125 GHz, allowing up to 1,200 MHz of additional spectrum. Access to the 6 GHz frequency brings more bandwidth, faster speeds, and lower latency, opening up resources for future innovations like in AR/VR, 8K streaming and more.

We have also developed the AI-Driven Mesh Technology, using this technology the Deco X90 automatically learns the network environment, client quality, and user behaviours connected on your home network and with sophisticated, multi-factored algorithms. The AI-Driven Mesh technology identifies the WiFi network usage, understands the network usage and customises the network unique to your home network requirements. We are looking forward to a challenging future and adapting ourselves to be at the forefront. 

Router manufacturing technologies have evolved and come a long way over the past 20 years. Routers have been redefined to respond to the ever changing demands of connectivity and the latest advancements in the field of technology. Over the next 20 years, routers will continue to experience significant changes as consumers incline towards digitisation and the Internet of Things (IoT) becoming a part of our daily needs. Research is being conducted to determine better router designs with robust hardware enabling high speeds and stable connectivity with increased speed of output queues.

Consumers are demanding better experiences of every kind. As consumers experiment with the online variations that promise new modes of product discovery and acquisition, the channel market holds fast to the tried-and-true channels that have become ingrained in their routines.

The future of consumer buying is not a shift from traditional to digital, nor is it an abandonment of self-service in favour of delivery, consumers want value-based experiences, experimentation, best prices, and convenience. The most successful forthcoming innovations will yield new products, services, and delivery models that cater to all those consumer motivations at once. As consumer-facing businesses enter the most frenzied phase of innovation, they must use their experience to study the data they have in order to empower
