

The onset of 21st century has seen technology evolve in leaps and bounds, and we have seen changes occur that we could not have even imagined back at the turn of the millennium. Twenty years ago, computers were heavy, bulky and took up a lot of space on a desk. They were slow and unreliable, with the graphics being a lot slower than what we are used to today. Memory in computers was also limited, so external hard drives were common, and most importantly, calling a computer portable was not even believable. 20 years from dawn of the new millennium, humanity has made immense technological advancements in the fields of PC consumer and PC gaming industry. In last 20 years, technology has become more personal and portable, ushering in a new era of personal technology and today, it's hard to imagine a world

without computers. They are smaller, faster and more convenient than ever, and an important part of our daily life, as we use them at work, home and even on the move. Rather than taking up a whole space, computers can fit into a handbag in the form of a tablet or notebook, to be carried wherever you go.

With the first laptop developed in 1981, the industry has undergone several makeovers. Laptops today are much modern in design. Powerful PCs have become the need of the hour. With rise in digital footprint and new-age creators, the need for high-end graphic computers have emerged in past few years. PCs today have elements of tablets and smartphones, making it more interactive and a one-stop device for both professional and personal needs. The industry has seen some really big changes in

set newer standards for run time making modern PCs conveniently portable, to built-in noise cancellation technology, the innovations has made personal computers more personal and user-friendly than we could have imagined years ago, leading to an exponential growth of the PC industry. As per Gartner, PC shipments, which include both laptops and desktop computers, witnessed fastest quarterly growth in 20 years in Q1 2021.

Speaking of innovations, biometric security opened up a new chapter in personal computing, making users' PC experience more secured and personal. PCIe, USB Type-C, Bluetooth, Wi-Fi and HDMI further enabled devices to seamlessly connect with other components. Huge advancements aided by increasing internet speeds have also strengthened the online gaming

the last two decades. Display alone has seen a great innovation over these years. Evolution of Full HD, Dual-display, smart screens, and OLED display became one of the key elements of a good laptop, offering flexibility for multi-tasking and screen space to do more. One of the biggest triggers for these progressions in the PC industry is the huge shift in consumption pattern, leading to rise in demand for systems which are multiple time faster than that of yesterday, opening opportunities for OEMs to make more powerful and efficient processing technologies, bundled with multi-threading, GDDR6 video memory, DDR4 RAM, 7nm and 10nm manufacturing nodes. From innovation in battery designs, which have

industry, empowering consumers digitally. PCs with gaming graphic capabilities advanced hugely in the last 20 years, growing from colour blocks through pixelated images, arriving at the near life-like quality of imagery we see today. This has urged the OEMs to foray in dedicated gaming segments, providing a whole new face to the online gaming space. These changes have brought us to a world where technology touches nearly everything we do.

Just 20 years into the 21st Century, we have already seen remarkable changes. If so much can change in such a short time, we can only imagine the new technologies and trends which will shape our next 20 years and transform lives. The PC industry is at cusp of a significant change and we anticipate that coming two decades are bound to
