

Inflatable Spine Implant

A team of engineers and clinicians at the University of Cambridge have developed an extremely thin inflatable device which can be used to treat the most severe forms of pain without the need for any invasive surgery. The device uses a combination of soft robotic fabrication techniques, and ultra-thin electronics and microfluidics. The inflatable is about as thick as a human hair. It can be rolled up into a cylinder and inserted into a needle, via

which it can be implanted into the epidural space of the spinal column. Once in the correct position, the device can be inflated with either air or water. It then encases a large area of the spinal cord. The device can then be connected to a pulse generator; the ultra-thin electrodes on the device send small electrical currents to the spinal cord which disrupt pain signals. This method of pain treatment has shown to be effective for many forms of severe pain, including leg and back pain, which are often not remedied by painkillers. Over time, this could also perhaps evolve into a potential treatment for serious diseases such as Parkinson's, and even to treat paralysis.

Symfonisk Picture Frame Speaker

Part of IKEA's third collaboration with Sonos, the Symfonisk Picture Frame Speaker is a 22 by 16-inch WiFi speaker that looks like a picture frame. You can hang it on the wall in portrait or landscape orientation and it will blend in with any other paintings you might have, or just look like a nice picture frame on the wall. Sonos haven't exactly provided details about the speaker's capabilities, but they have gone on record saying the speaker is "room filling". For this particular speaker, Sonos claims to have focused on the architecture of the speaker, specifically the tweeter design. It supposedly uses a special diffuser to help high-frequency sounds spread around the room. Along with the tweeter, you also have a mid-bass woofer, which could be similar to the one in the Symfonisk Table Lamp Speaker, from a previous collaboration between the two companies. The speaker/frame has a depth of 2-inches, and has a power cable at the back, however, if you have more than one of these speakers, they can be connected to each other so that only one of the speakers needs to be plugged in. The included power cord is 12 feet in length, so you should have more than enough to reach the nearest outlet. The frame itself comes with a magnetic hook for easy mounting and unmounting.

Rocket XTRM-Q

The Rocket XTRM-Q is an external SSD, which packs a massive 16TB of storage space. That's not a typo, 16TB (not GB) of storage space. The Rocket XTRM-Q features dual 8TB NVMe SSDs inside, for a total of 16TB. All the space comes in a very compact frame, measuring just 4.5-inches long, 2.56-inches wide, and 0.68-inches high. The entire body is made out of aluminum, making it pretty sturdy. This also helps the SSD dissipate heat better, which is especially important when it comes to SSDs. In addition to the aluminum body, the SSD comes with a rubber case on top, for added protection.

The two 8TB NVMe's inside can be run individually, or they can be run in RAID 0 mode for a total of 16TB storage. In RAID 0 mode, the drive's speed also doubles to 2800MB/s. Of course, to support this the drive comes with support for Intel's Thunderbolt 3; a Thunderbolt cable and power adapter are provided with the SSD. Of course, this doesn't come cheap, the Rocket XTRM-Q will launch for a whopping \$2,899.99. You could actually build a pretty decent gaming PC with that budget.
