

DROOLMAAL

SN-3 Nova

The SN-3 Nova is a concept robot dog that is designed to aid technicians with inspections and repair tasks in places where it would be dangerous for them to go themselves. Although it doesn't look very friendly, it's definitely still designed to be man's best friend. The SN-3 features a robust and sturdy build, understandably, considering the kind of environments that it's intended to be used in. According to the designer, this robo-dog is capable enough to be a part of a disaster management fleet, or even part of a military dog squad. SN-3 is equipped with EndoWrist instruments on the front, for carrying out repair work, however, this can also be modified to allow the dog to perform surgical procedures. The dog also features 3D laser scanning, with an HDR camera and a high-precision CMOS sensor. The Nova is powered by a 48V li-ion battery pack, located right behind its head, which can be swapped out when needed.

Xupermask

Will.I.am and Honeywell have come out with a new facemask (which would have been surprising two years ago, now not so much) which they're calling the Xupermask. This "supermask" is named so because of all the extra goodies it has packed into it, which include built-in noise-cancelling headphones with Bluetooth 5.0 connectivity, a charging port, and LED light. Plus, it looks really cool too, designed ergonomically with a silicone face seal that should fit any face, regardless of size. The Xupermask also houses two dual-speed fans to help with breathability, and HEPA filters to keep the air clean. The mask's battery will last a supposed seven hours, which should be more than enough for the majority of facemask use-cases. Commenting on the facemask, Will.I.am said, "We created Xupermask to change the game of our new normal. In this new age of style and security, Xupermask is an uncompromising face mask design with high-tech performance for the modern lifestyle."

LV Horizon Light Up

The Louis Vuitton Horizon Light Up wireless speaker is a leather-bound beauty that looks like a UFO. One look at this device and you can tell that it's out of this world. Pun intended. The LV monogram is pretty prevalent on the device's surface, embossed with leather. The speaker itself comes with a subwoofer, surrounded by RGB lights, which make the LV flow insignia glow. Sound can be directed in a specific direction, or be set to 360 degrees, but setting it up on the included stand. You can pair with the Horizon Light Up via Bluetooth, WiFi, AirPlay 2 and more. The speaker comes with a leather strap as well; its compact size and design make it an ideal speaker for carrying around. The speaker is expected to launch worldwide on July 30th, LV haven't yet provided details on the pricing yet, but expect it to be pretty exorbitant.
