

DOES THIS SECTION EVEN NEED AN INTRODUCTION? FROM COMPUTERS TO MOBILES, AND HEADPHONES TO GPUs, IT'S ALL HERE...

THIS MONTH IN TECH: Learn about Skylo and Immarsat Satellite IOT and how health trackers track your data. Next, we have a workshop for PopOS with BTRFS. Learn what it takes to be 3D Printing Technician in Careers, and more...

Amazon might run out of people to employ

Amazon executives are concerned that they have been burning through warehouse employees too quickly that they might end up running out of people to employ. Amazon has even started offering signing bonuses to attract more people.

WHAT'S NEW

Windows 365 brings Cloud PCs

Microsoft has announced Windows 365, a new Cloud PC service that allows businesses to access a remote PC via a web browser. With the upwards trend in remote working, a Cloud PC service such as Windows 365 makes business sense. The Cloud PC retains its state so users can access their Cloud PC from anywhere and pick up from where they left off. As of now, the service is only open to businesses and will come in two flavours – Business and Enterprise. Microsoft is leveraging their Azure cloud computing service to bring Windows 365 to life. These cloud PCs can be configured to run on a single CPU with 2 GB of RAM and 64 GB of storage and scale all the way to eight CPUs along

with 32 GB of RAM and 512 GB of storage. In this scenario, the CPUs refer to processor threads. While this is certainly not the first virtual machine service, it is certainly a more simpler and easy to boot package that's more user-friendly since there's no need for the users to be technically proficient to run a virtual machine as was the case traditionally. <https://dgit.in/Win365>

Ransomwhere, a ransomware payment tracker

Ransomware attacks have grown by leaps and bounds during the Covid-19 pandemic and the actual impact of such attacks remains largely unknown. Ransomwhere is a platform aimed at adding visibility to this digital menace. Ransomware payments are largely made using some cryptocurrency or the other. Since there's no individual platform or security agency tracking these payments, the attackers have

managed to largely remain anonymous. Ransomwhere will put an end to that with its

crowdsourcing initiative that encourages victims of ransomware attacks to report how much they paid and to which

crypto-wallet the payment was sent. This crowdsourced information will allow security agencies to follow the money and identify the culprits behind ransomware attacks. The website has already started tracking more than USD 32 million in ransom payments which were made in 2021 of which a bulk of the payments seem to have been made to REvil, a known ransomware gang. <https://dgit.in/RansomWhere>

Steve Wozniak stands up for Right to Repair

Apple co-founder Steve Wozniak recently came out in support of the Right to Repair movement and made his stance public in a note sent to Louis Rossman, a right-to-repair advocate, via Cameo.
