Narrowband satellite IoT

The first of its kind solution in the world has been deployed in India

Aditya Madanapalle | aditya@digit.in

n June, Skylo announced a partnership with Inmarsat to provide the connectivity

backbone for its IoT solution.

Consider a whole bunch of sensors in a farm growing potatoes, a truck transporting vaccines, a goods train

loaded with oxygen cylinders or a shipping vessel trawling alone in the middle of nowhere. These sensors in remote areas can indicate temperatures, if containers have been tampered with, the amount of liquid flowing through, the pH level of the soil, the geolocation and so on. All the sensors relay information to the Skylo Hub through Bluetooth or wires, which acts similar to a local Wi-Fi hotspot, but instead of connecting to an ISP, it links up

straight to satellites in orbit, providing IoT connectivity in the most remote areas, beyond cellular coverage. The information from the sensors are fed back to the businesses or organisations on the ground that need the real time intelligence, plugging into their existing systems. The announcement was for the first commercial narrowband IoT satellite solution in the world.

Skylo CEO and co-founder Parth Trivedi said, "Even more attractive than a sharp increase in adoption due to low barrier-to-entry, is deploying critical new business capabilities as machine data becomes readily available and accessible. Our global IoT connectivity fabric makes way for thousands of life-changing applications — from managing vaccine efficacy during delivery, to advancing precision farming, to providing early warnings in the event of natural disasters. We look forward to expanding globally and making our platform available to small and large enter-
