notes, quizzes, assignments through our LMS and inhouse exam portal ,CV builder, career guidance classes to help them decide the right path after graduation." We then asked about the benefits of the Protrainy platform to the students, "We are catering to the students to make them Industry Ready. We provide live training in

hotspots such as reception desks and consulting rooms, after every patient visit. The UV sterilisation tech uses innovative tech hidden away discreetly within handrails, with smart sensors embedded throughout. Additionally, the entire system has a modular design, which allows the purification systems to be setup sim-

within reach of the users near the handrail which is why we decided to integrate the lights seamlessly into handrails. This was also verified by the various simulations and testing with the UV meter." The team was researching and designing low cost medical devices when the pandemic broke out and then came together to pool their expertise to address the new concerns raised by the outbreak, "when the pandemic began, Krishna, Deepika, Shreyas and Vivek started collaborating together as designers and engineers since we were all driven by the passion to create impact. Krishna Thiruvengadam is an Impact Designer with a Masters in Product Design from TU Delft, Netherlands. He was awarded the James Dyson Award for Excelscope, a low-cost AI-based malaria diagnostic device and his work on developing a non-braille human computer interface that assists blind people coders has been published in Nature, the world's leading scientific journal. Deepika Gopalakrishnan, a recent product design graduate from PES University, Bangalore, has published a research paper on designing a healthcare monitoring device for pregnant women in Springer and presented her work in the International Conference on Research into Design 2021 (ICoRD). Vivek Devaraj, coming from a Masters in Automotive Technology from TU Eindhoven, Netherlands, has more than 7 years of work experience in product development and automotive engineering.

A Protrainy classroom

non IT technical employable skills for graduates with the aim to make them Industry ready. Currently we are catering to civil engineering students and working professionals to provide live and blended learning .Our trainings are companion to the existing curriculum of the institutes and help the students become industry ready before they graduate."

When asked about the experience of working with Nexus, Protrainy told us, "Nexus is the best place to be for any early stage startup in India. The mentoring, the team, the connections are huge and obviously the associated brand name. We have been somehow associated with other such programs also but we can proudly say the warmth the handholding that Nexus provides is unmatched."

DVERSE LABS MAKES HOSPITALS SAFER

dVerse Labs is a timely startup, that uses modular auto cleaning components to purify common touchpoints such as elevators and handrails. The current deployment setup is specialised for hospitals, and sterilise

ilar to LEGO bricks. One of the first questions we had was the innovative development of a modular system, and its efficacy. "UVfy is a sterilizer that consists of handrail modules that can be assembled onto confined spaces like elevators. It uses UV lights that turn on automatically after every patient visit. The metaphor of LEGO is being used with respect to the modularity of UV-light enabled handrail modules to suit confined spaces of varied dimensions. The effectiveness of UV light decreases with distance from the target to be disinfected. Most of the common touchpoints are
