All of you video editors of the world would be aware of the 'pro tools' that are used in the industry, like Final Cut Pro, and Adobe Premiere Pro, with Final Cut being an Apple Exclusive and Premiere working on both Windows and Mac based systems. But, there's one underdog on the Apple side of things that does not get talked about much, but from what we have come to know from using it for editing videos, it does pack a punch. If you haven't guessed it till now, we are talking about iMovie. Yes, that free software that comes installed on Macs and can be used to edit videos. There's a lot more to it than what meets the eye.

Many of the biggest names of the world of digital content creation, especially on YouTube, like Casey Neistat, started their video editing adventures on the early versions of iMovie. Such is the power and capability of this tool. The most significant advantage of iMovie for amateurs and professionals alike is the ease with which the projects can be moved from one machine to another. Since there is a version of the app available for all three of Apple's devices, namely the iPhone, the iPad and the MacBook, in order to shift your workflow from one machine to another, all you need is to AirDrop the file to whichever device you want to. Another advantage is that you can open your iMovie projects in the flagship Apple video editor, Final Cut Pro. Say you have a vlog to edit, and you are on a flight. What you can do is create a rough cut on iMovie using

your iPhone or iPad and then transfer all of it into Final Cut on your main editing machine once you land.

Given that it is a free software, it is not as resource-hungry as compared to some of its counterparts that have the 'Pro' label attached to their name, iMovie is fairly capable of an editing software. It may not have the fancy tools that will let you edit a feature-length film, but if you are a small scale creator who wants to edit his or her videos without much hassle on a machine like a MacBook Air, then iMovie is something that can help you get started on your video creation journey.

GETTING STARTED

There is nothing much attached to firing up iMovie on your Mac for the very first time. The theme of simplicity

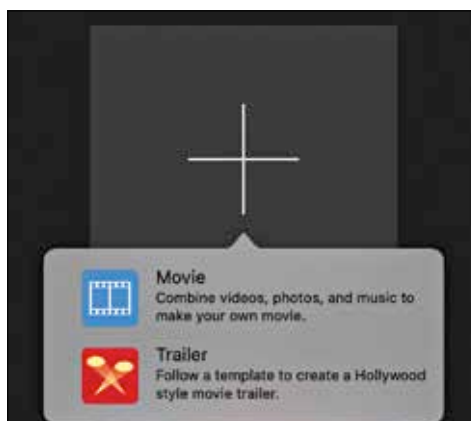

is carried over into the first use of the software. Just a few clicks that prompt you to agree to certain terms and conditions, which we do recommend you read before accepting. After that page, you are greeted with another prompt that tells you what the latest and greatest features in this app are, and once you are through that, you will land on the page with the option to create your very first video project, and that's where the fun starts.

Once you are on the page that has the option to create your project, there are two primary options that you can choose from. The first one is that of creating a Movie, which, as described by the makers of the app is your standard video editing project which can be used to combine video footage with music, effects and photographs to create a movie. Then is the Trailer option that is like a preset, along with a template that you can follow to create what is called in the software as a Hollywood style movie trailer. We will stick with the standard Movie option because the Trailer mode is really easy to understand and use and does not need much explanation.

MAKING THE CUT

After setting up your project, the rest of the process is quite intuitive. If you have even the tiniest bit of experience working with video editing software, you will have no issues apart from a few hiccups here and there. On the page that opens in front of you, there is a giant button labelled as "Import Media". That's where you will have to click in order to get all the music, clips and whatnot that you want to put into the video that you are creating.

Post that, the process does not require much effort unless you are trying to copy the Snyder cut and make your own version using the clips that you shot on your last vacation. The files, once they are there in your project library, can be dragged and dropped onto the timeline, which is also labelled with a sentence that says the exact same thing, "Drag and drop video clips and photos from
