

The landing page that you see after creating your 'Movie' project

the browser above to start creating your movie”.

Once you have all the media arranged neatly on to the timeline, you now want to start adding the cuts, removing the unwanted footage and sewing together your next master-piece. There are a lot of shortcuts that you can use for each of the actions like cut, copy, paste and play in the software, and each of these can be found on Apple's support page for the software. (Link: <https://dgit.in/imovg>) But, what is there in the world of computers that cannot be done using the good old right-click? Whatever you want to do, is right there baked into the menu that pops up when you hit the right click on the timeline.

So, while you learn each of the shortcuts, the right click is there to serve you well. After you have the cut points ready, it is time to add all the transitions and texts (with backgrounds) into your potentially viral creation. For that, head over towards the top of the screen where you will find, just next to the My Media option,

other clickable buttons, labelled as Audio, Titles, Background and Transitions. Each one of these is self-explanatory, and the process of adding them is pretty simple too.

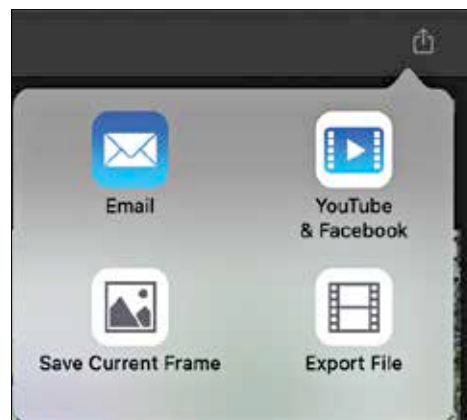

In the Audio section, you can play around with the audio that is there in the clip. The remaining three have a host of options to choose from. While navigating the Backgrounds, Titles and Transitions page, in order to preview each of the listing that is there, all you need to do is just click it once and hover your cursor over it, and you will be able to see the preview in the pane right next to it.

When it comes to features like in-app audio editing and colour correction, there is not much to see here and play around with. iMovie is a basic editing kit, and that is aptly reflected in the options that are there for the above-listed tweaks. These options can be found right above the preview of the video clip. Keep in mind that any changes made

to the values here, are applied to the clip(s) that has been selected.

THE LAST MILE

You have applied all the effects and cut all the media that was there on the timeline, and now all that remains is to export it for it to be ready to be uploaded on the internet or show-cased wherever it is meant to be. In order to do this, you will have to click the small button on the top right corner of the app, which looks like this . After you have clicked this button, you will be greeted with some more prompts, and each of them is there to cater to one specific need. Say you want to just export the video for YouTube or Facebook, select the option called YouTube & Facebook, choose the resolution that you want to have

Each of the options have their own presets which can be used

your video in and hit export, and voila! You have your video ready. If you are someone who wants to play around with the export values a bit, choose export file, and you will be set.
