

help the users of this app tremendously, by saving them a ton of time, which would have, in turn, gone in just manually opening the app, waiting for it to load and then assign the status of the task.

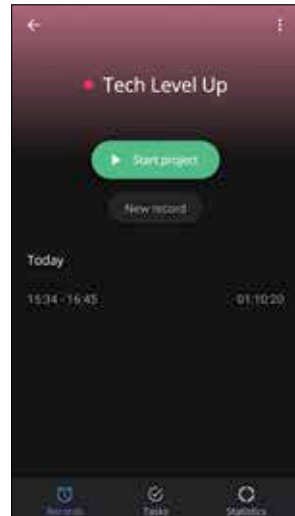

BOOSTED: PRODUCTIVITY AND TIME TRACKER

How many times has it happened to you that you were working on a project and just 15 minutes into it, you think that an eternity has passed when it has been just 15 minutes of you fooling around? You've just been trying to figure out what it was that you were starting to do? Well, in that case you could have resorted to take help from an app, to track how much you were distracted by another app. It's better to use the stones to destroy the stones, right? Well, we think so and have brought to you some tips which you should follow to add another mile to your run, which you are doing, with your fingers on the keyboard or with a pen on a sheet of paper, using the app called Boosted: Productivity and Time Tracker.

CHANGE THE DAY YOUR WEEK STARTS

Almost everyone across the globe has their week start on Monday. Well, that should not apply to you, because you are special. If you consider yourself to be special, you should try using the feature in Boosted that helps you change the day when your week starts. All you have to do to change the day when your week starts is, tap on the three bars at the

bottom left corner of your screen, go to the settings menu and find the option labelled 'First day of the week'. And that's where you've made it. Choose the day when you want to start

The project page in Boosted

your week and plan your projects accordingly, giving yourself a nice weekend break right in the middle of the week, say on a Thursday. There's no stopping now.

ADD TASKS TO YOUR PROJECTS

Many users of the app may have overlooked this feature and must be timing themselves for the entire project as a whole, and at the end would not know where it all went wrong, and wonder what

to change in the next one that they pick up to do. But, there's a thing that you can do within the app itself. You can create Tasks within your project, which you can time individually, and they will add up to your entire project's timing, so that next time you overshoot the deadline by 5 hours, you would know where exactly it all went wrong. In order to add tasks to your project, you will have to click on your project, and then navigate to the Tasks page, which can be seen on the bottom of the page. Once there, you can add a new task or as many new tasks as you want, and these are the ones that can be timed individually.

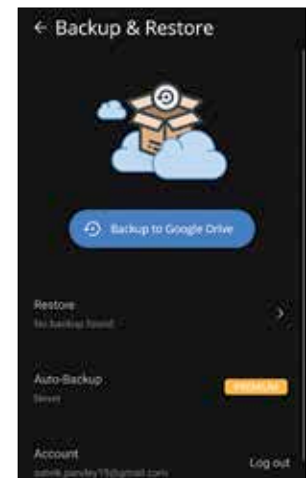

MANUALLY ADD TASKS THAT YOU FORGOT TO TIME

There are many instances when people are so excited for their work, or in such a hurry that they forget to log in their hours into the app. The folks at Boosted have them covered with their New Record option which allows users to add their own time bracket where they worked on the ongoing project. Once you are on the project page, you can click on the New Record button and add the new record with your own parameters which can be

defined either by using the slider on the top of the page or the Set Time Period Toggle in the bottom half.

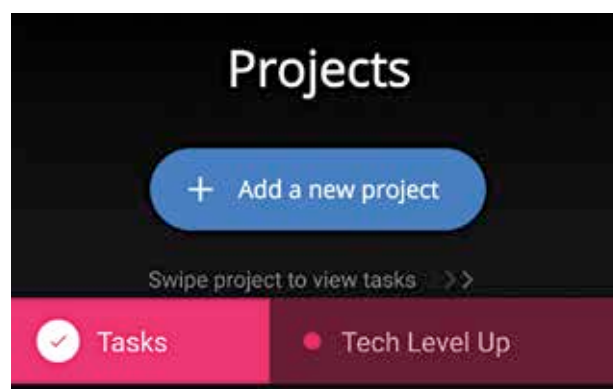

BACK UP YOUR DATA TO GOOGLE DRIVE

How many times have people lost their tracking data on apps since it wasn't synced to their account, especially when a user recently switched their device. But, there's a way in Boosted that can help you avoid all of these mundane worries. You can actually create Google Drive backups of your data. To do this, you will have to go

The backup button which is to be clicked in order to start the backup to GDrive

to your app's settings, and then navigate to 'Backup and Restore'. You will then be asked to sign in, and when you do so, you will get a prompt, asking you to grant certain permissions to the app. Once, the permissions have been granted, you can setup automatic backups if you are a premium user or manually hit the 'Backup to Google Drive button' to send all of your precious tracking data into the safe haven of your Google Drive. 

You can swipe right on the projects to view the tasks within it
