Teardown: Apple TV 4K 2021

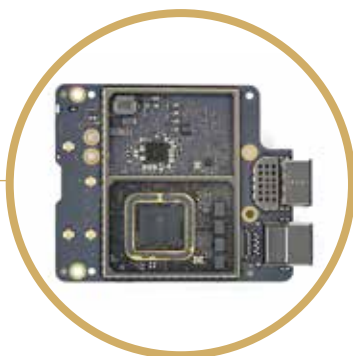

Apple's latest streaming box is as repairable as ever

Dhriti Datta | dhriti@digit.in

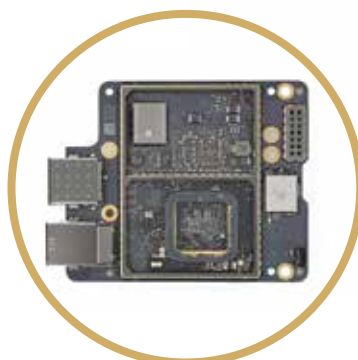

Prying open the black box

The snap-on base on the underside of the Apple TV box comes off easily with little effort and few tools required. There's no adhesive or screws, so it's a pretty simple process. Underneath, there is a full metal fan unit and not the heatsinks that were present in previous generations of the Apple TV. Disassembling the cooling unit is also a breeze.

Examining the logic board

A few Torx screws stand in the way of freeing the logic board from the body of the device. Once these screws are extracted, it exposes the chips on the logic board. These chips include the Apple A12 Bionic SoC (same SoC as found on the 2018 iPhones), Apple APL1091 338S00673 power management IC, Broadcom BCM57762A0KMLG Gigabit Ethernet Controller, Macronix MX25U8035F 8 Mb Serial NOR Flash memory, and a few others.

Examining the underbelly

To know all the chips present on the top side of the logic board, head over to the iFixit teardown of the Apple TV 4K. Now, as for the underside, the logic board houses a fair number of chips here as well. These include the Kinetic Technologies DisplayPort 1.4 to HDMI 2.0 converter, SK Hynix 32 GB NAND flash memory, Murata Wi-Fi/Bluetooth Module, Lattice Semiconductor audio return channel receiver/transmitter, and a few others.
