As repairable as ever

The Apple TV 4K 2021 is as repairable as previous iterations due to its modular construction and the fact that there are only a handful of major components in the device which simplifies repairs. The remote can be slightly difficult to service since it is guarded by Pentalobe screws but it isn't glued together.

Apple TV
4K

Remotely easy disassembly

Moving on to the remote, disassembling it is a moderately easy affair as well. You remove two P2 Pentalobe screws from the bottom edge of the device and separate the circular clickpad from its mainboard. The battery and charging port combo connects to the backside of the mainboard via a ZIF connector. The power cell offers 1.52Wh, slightly lesser than the previous model.

Power supply board

The power supply board lies buried under the metal body for adequate heat dissipation. You can find the same conductive posts and modular C7 socket as in past models. There's some more silicone present on this board which includes the Diodes Incorporated (formerly Lite-On) ABS20MH bridge rectifier, Infineon IPD65R1K4C6 N-channel MOSFET, and NXP Semiconductor TEA1833LTS switched mode power supply controller.
