

XTAR SN4

Funding: US\$ 37,382 pledged of US\$ 5,000 goal

Link: <https://dgit.in/xtarsn4>

XTAR launched a Kickstarter campaign for its new product, a modular seven-in-one camera battery charger that allegedly saves space and time. The charger supports major camera brands and accessories, and the company has promised that support for even more will be instilled in the future. If you're a photographer or a videographer, most of you must have experienced the need to charge multiple batteries on the go to keep long photo or video sessions

going without a hitch. It can become pretty cumbersome to carry numerous chargers to the shoot, especially if you have several cameras from different brands, that each come with their

own charger. XTAR claims that their product, the SN4 battery is a solution to this predicament. It is a modular camera battery charger that utilises a single charging base with a series of attachable docks that charge different devices. It uses a Type-C charging cable and the charger can be powered by a PD or QC adapter indoors, a car adapter in vehicles, or even a USB power bank. The company has stated that when the device is connected to an XTAR PD45 adapter (available separately), it is able to support speedy 3A charging in a single slot. The company claims this is four times faster than the chargers that ship with the batteries by default.

Keyboardio Model 100

Funding: US\$ 325,861 pledged of US\$ 100,000 goal

Link: <https://dgit.in/keyboardiomodel100>

The Keyboardio Model 100 is a fully customisable mechanical keyboard designed to be highly ergonomic. It comes from the creators of the popular Keyboardio Model 01 that launched on Kickstarter in 2015. The Model 100 is the company's latest offering and comes equipped with 64 hot-swappable mechanical key switches, customisable RGB LEDs, custom-sculpted keycaps and open-source firmware. The keys look premium and are made out of walnut or maple hardwood. The keyboard features a butterfly design that is meant to be more ergonomic for daily use. The company says that it has aligned the Model 100's keys in columns, making it easier to reach without contorting your fingers. The keys are angled and allegedly help keep your wrists in a natural position when typing. One of the Model 100's most unique features is the palm key that can work as a special shift or function key and be pressed by the underside of your palm easily. The keyboard also has curved palm rests to support your hand in a relaxed, neutral position. The two halves of the Model 100 are connected with a standard RJ45 ethernet cable. There's also an open-source firmware called Kaleidoscope where you can build complex macros, add joystick emulation, and much more.

Phantom robotic chessboard

Funding: US\$ 607,986 pledged of US\$ 6,000 goal

Link: <https://dgit.in/phantom>

Fans of the Harry Potter series will fondly remember the legendary scene from the first film and book with Harry, Ron and Hermione playing a deathly game of Wizard's Chess when attempting to find the Sorcerer's / Philosopher's Stone. We were all enraptured by the chess pieces moving autonomously on one end, while the other end could be controlled by the characters speaking the moves. Turns out, Phantom, an

extremely cool robotic chess board has the ability to transform this magical scene into reality! The board is equipped with a hidden robotic arm that smoothly moves the chess pieces by listening to your commands or by registering a move made by AI or a remote player that could be playing from across the globe! The wood chess

pieces used on this exquisite board are handcrafted in India and the board features an open API. So, if you've been playing chess on an app with players across the world, you can simply bring that to real life with a tangible chessboard that moves pieces in accordance with the moves made by remote players. The board also comes with Phantom Tutor, a personal chess trainer that remembers your every move and gives you precise recommendations on how to improve.

In its Sculpture Mode, the chessboard can play back some of the most iconic chess games in history autonomously allowing aspiring chess players to learn from these master moves.
