

iPhones will be able store your IDs

Apple has unveiled a feature allowing customers to add their ID's on iPhones as a of identification. <https://digit.in/jul21-83>

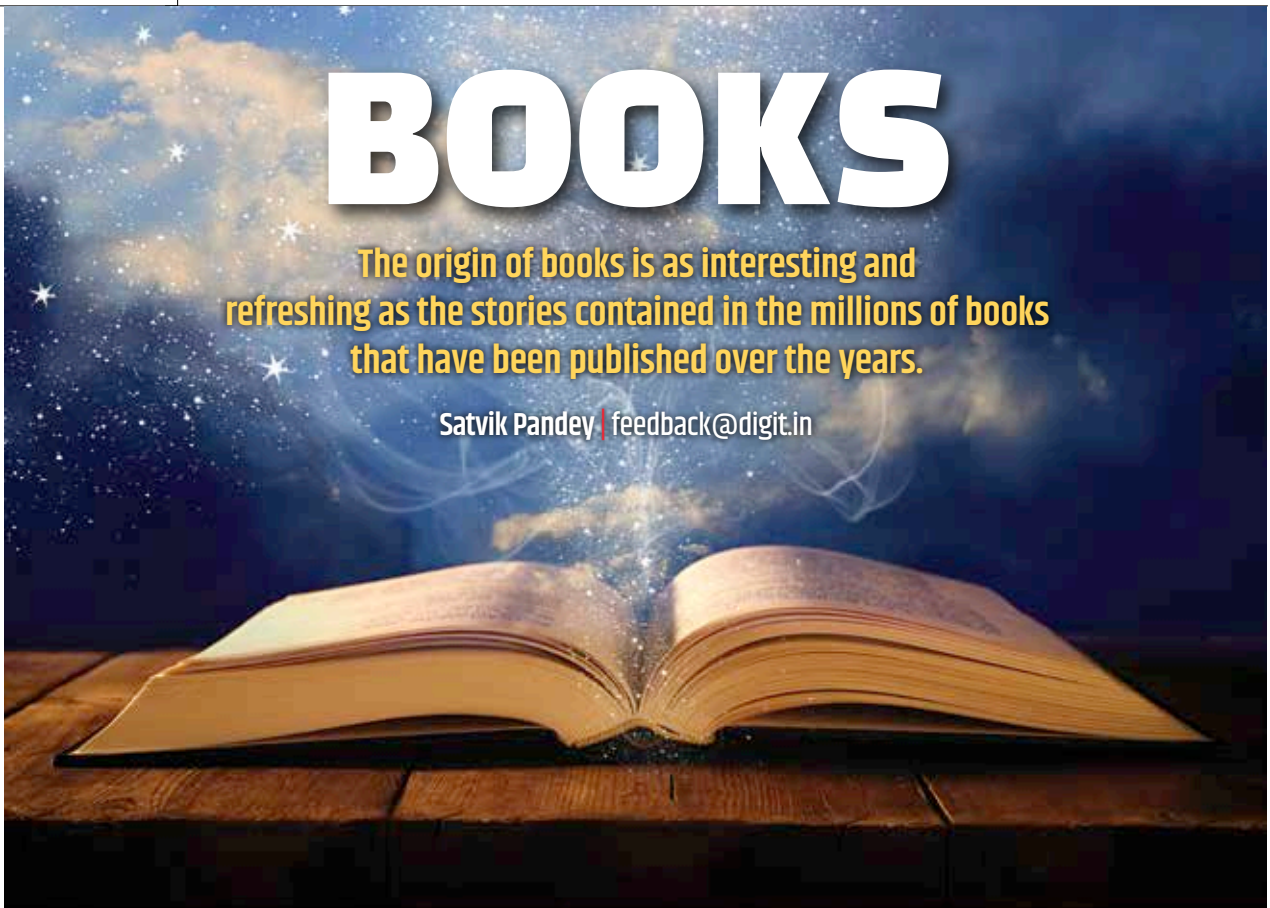

RISC and x86 under same roof?

Intel has offer a \$2 billion to SiFive, a startup semiconductor designer pioneering in RISC-V architecture. <https://digit.in/jul21-84>

BOOKS

The origin of books is as interesting and refreshing as the stories contained in the millions of books that have been published over the years.

B

ooks as we know them, have been a part of our lives for thousands of years. They have been

enabling us to document everything from art to scientific knowledge in an organised fashion, allowing us to dissipate information across generations. It all began as early as 4th millennium BCE, where scrolls were used as the primary medium of documented communication. These scrolls were made of different materials based on the region they were created in, but the most common and reliable material was one that most of might remember from our history lessons – papyrus.

The scrolls that were made at the time could stretch up to 14 to 52 feet when spread apart. The other materials that we were talking about, used to come from a wide variety of natural sources. Everything from metal, leather, clay, stone, and bone

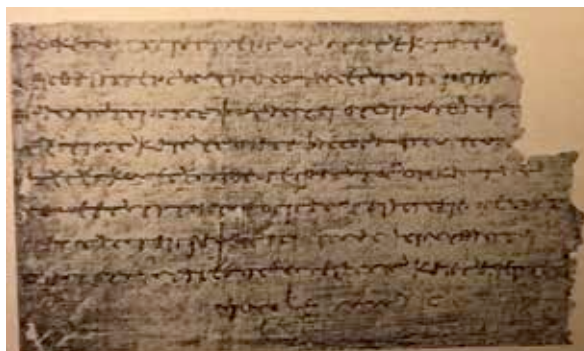

were used as writing surfaces by the ancient Egyptians, who are believed to be the pioneers in developing the earliest concept of books. These scrolls were made of individual pages that had been glued together. The ink that was used in this period was as interesting as what was written on the scrolls. It was of primarily two colors and consisted mainly of iron and orcher, which were the pigments, and phosphate, sulfate, chloride, and carboxylate ions were also added

to it. Lead was used as the drier, which would aid in the drying process of the ink.

It was not just the Egyptians who had experience in documenting things on a surface with the help of ink. The Romans too were contributors to the history of books. In fact, they were the ones who brought to us a primitive form of the books that we have today. They developed what were called codices as early as the 1st Century CE. These codices were

made of parchment paper, which was then bound together by wooden covers on either side.

Parchment paper at the time was made by treating animal skins which resulted in what would be a better, more durable material than the papy-

An official letter on a Papyrus of the 3rd Century BCE.
