

Windows 11

The last Windows
you'll ever need, probably

"WINDOWS 10 IS THE LAST VERSION OF WINDOWS"

At the release of Windows 10, we were led to believe that it was the last version, at least for a while. We were treated to feature updates and changes and thought that would be it. The billion-dollar tech giant had a timeline of scheduled updates with regular rollouts, and that would be all that we would be getting while being a part of the Windows side of things, with no parallel development of the next numbered version. As we were buying into the hype that was, at least for us geeks, the next major update to "Windows"; Microsoft announced the release of Windows 11. So sudden was this development that we were caught unawares, which is saying something in this era of regular rumours and even planned leaks by companies.

Of course Microsoft is as leaky a place as always so early builds were leaked, but we obviously could not write about those. Then, on June 24, 2021, Microsoft officially unveiled Windows 11, and we scrambled to find everything we possibly could to cover it for our July cover story.

So is Windows 11 an all new version or just a skin on top of an updated Windows 10? Is it worth the hardware upgrade, and what do you need to know about the next version that promises to be the last one you ever need (until Windows 12, we presume). The folks at Microsoft say it is, "A new Windows experience, bringing you closer to the people and things you love." But is it? Let's find out shall we?
