Have all your old apps in their old positions as soon as you connect an external display

Microsoft Teams - built right into the Taskbar

Since the OS supports devices of different input methods – touch, type and pen – Windows 11 is now more optimized to support those inputs. The onscreen keyboard has got a major overhaul, and is looking more like something we'd expect in a modern OS.

Windows 11 also features a small, one handed keyboard, which can be customized with different themes and it supports gesture typing too.

Microsoft claims that voice typing and dictation has been greatly improved as well, but we will wait

to test that for ourselves, especially testing for our Indian accents.

Touch input and pen input have been improved, and touch areas are now bigger – meaning you have lower chances of making errors when, say, trying to resize windows.

Microsoft Store

Coming back to the Microsoft Store as we'd promised, with Windows 11, you will be able to install Android Apps on any of your devices, thanks to support for the Amazon App store. This means that you will need to

have an Amazon account as well as a Microsoft account to be able to, you'll need to have an Amazon account and a Microsoft account in order to download apps from there.

Once downloaded, they will run like any Windows app. The first time that you try to download an Android app, the store will first download the Amazon App store and then it'll continue with the downloading of the required app. This opens a lot of possibilities for the Microsoft Store. Microsoft has already promised to bring Zoom and Adobe Creative Cloud over to the Store as well.

Of course we are yet to test how those apps will function, and we obviously cannot base that on leaked versions of builds. Keep an eye out for more stories from us that will test this Android-app integration in much more detail. It'll be especially interesting to see how Android Apps function in non-touch environments, such as on PC desktops. Maybe they won't work at all if there's no touch input, or maybe some apps will be restricted while others allowed. We also do not know if side-loading of APKs will be possible. 

Tik-Tok running natively on Windows 11
