

Matter Antimatter switch

Data analyzed from the LHC showed a particle switching from matter to antimatter at CERN. <https://digit.in/jul21-70>

Insulin 98% cheaper

Open Insulin Foundation to build the world's first open-source insulin manufacturing model. <https://digit.in/jul21-71>

Sailing Stones

How and why do these rocks move on their own?

Satvik Pandey | feedback@digit.in

In the millions of years that we humans have been living here on Earth, the planet has never failed to surprise us. We have mysterious phenomena such as waterfalls that fall upwards, circular rainbows and hills where vehicles appear to roll upwards... and moving rocks. These for many years were things that we knew about but little understood. It wasn't until the year 2014 that the mystery behind the rocks that appear to move was solved. The sailing stones phenomenon is a natural occurrence where rocks slide along the surface that they are placed on, without any animal or human interference, leaving a long trail

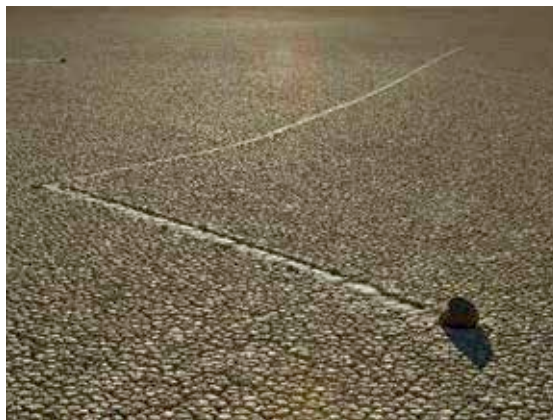

behind them. In the early 1900s when there were sightings of this phenomenon by geologists who claimed to have sighted these rock movements and spent years finding the origins of this spectacle of mother nature but could not come to a definitive conclusion. There were several speculations made in order to provide a little bit of reasoning so as to define the force or processes that went behind these rocks moving about on the floor of many places across the world, with the most famous site of

these observations being Racetrack Playa, located above the north-western side of Death Valley in the Death Valley National Park in Inyo County in the USA.

There were several observers and geologists that tried to allot some amount of reasoning to this phenomenon, but failed because all of this had been happening without any human or animal interaction, on desert ground, with no proven gravitational cause. It would not have ever come to notice of the people

examining that area if the tracks that these rocks had left behind hadn't stayed for a long enough time for them to examine them.

In the early part of the 1970s, the year 1972 to be precise, two individuals named Bob Sharp and Dwight Carey initiated a program whose sole intent and purpose was to monitor the move-

The moving rocks and the trail they left behind
