Nokia Clarity, Comfort, Micro, and Go Earbuds series announced by Nokia brand licensee HMD Global. <https://digit.in/aug21-02>

DEFENCE AGAINST PEGASUS

What is this cyber-weapon and how can you stay safe from similar malware?

Aditya Madanapalle | aditya@digit.in

P

egasus is a spyware that has apparently been in use since 2013. Its capabilities are constantly

evolving, using new zero day exploits, often in potent combinations to get into a device and stay there. Digital forensics expert Nikhil S Mahadeshwar, Co-founder & CTO of Skynet Softtech tells us, “the Pegasus spyware is a software originated from

an Israel private organization known as the NSO Group. This group has created global headlines as it sparked a lot of political controversies.”

The methods used to get on the device can range from a spear phishing attack, where a malicious link is sent over email, to a missed call on an instant messaging app that does not require any interaction from the user, the so-called zero-click intrusion. Venkat Krishnapur, vice-president of engineering and managing director, McAfee Enterprise India explains, “A spyware can take multiple routes to reach a target’s phone. Pegasus – which is a spyware, in particular, has evolved from the traditional socially engineered form, where victims would need to click on a link and download the spyware, to a ‘zero-click’, highly sophisticated

version requiring no user interaction. The ‘zero-click’ avatar exploits ‘zero-day’ vulnerabilities that are common in the OS or applications. Zero-day vulnerabilities are defects or holes in the software that are yet undiscovered and unpatched by the creators of the software. These are typically introduced due to poor coding during the software development phase.”

The NSO group offers the Pegasus platform as a product that is in active development, and as such is a cyber weapon, one that constantly adapts and exploits new and undiscovered vulnerabilities. Krishnapur gave us some insight on what it takes to keep such a product in development, “highly trained and experienced researchers work to just identify flaws in the software that are not yet known to the vendors and once the
