

might screw up the entire widget. Now, in the code, you will see a chunk labelled in most cases as 'style' or 'position'. This will be the one that will help you change where your widget is shown. There, you can change the values adjacent to the text "bottom" and "right" to move where your widget is placed on your screen. Just below that, in this case, are the options of changing the font colour and style. Search the internet for the hash code of your favourite colour and key it in and do the same for the font too. You will be set. Hit command + S, and your changes will come into effect.

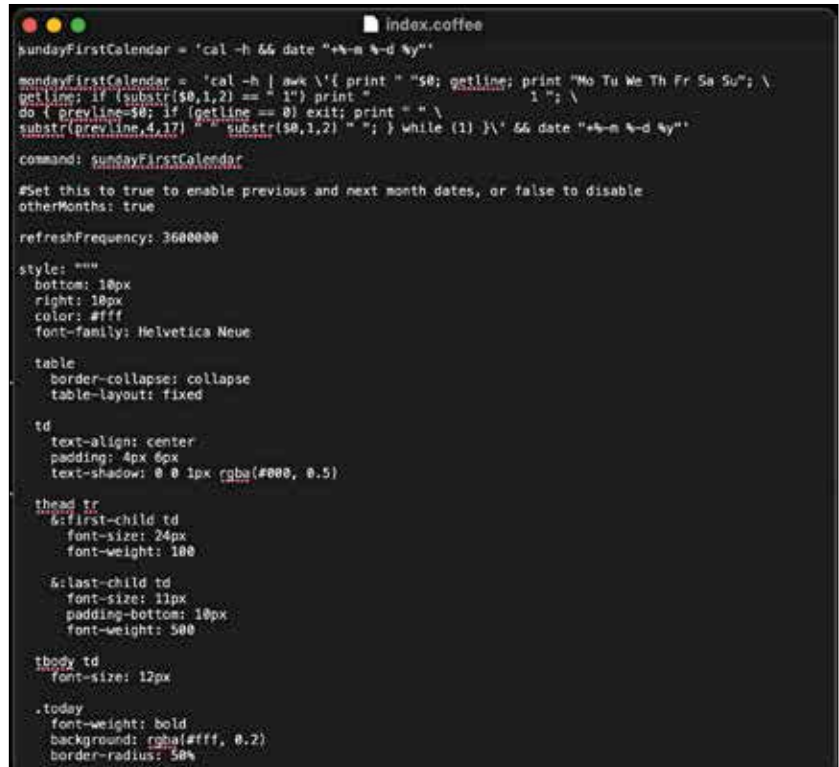

If you want to remove a widget temporarily, you can do so by going into the Übersicht menu, navigate to the widget and clicking on the 'Hide Widget' option. But if you want to get rid of the widget completely, you can go to Übersicht's widgets folder and delete the folder of the widget you want to remove.

WHAT NOT TO DO?

We already told you that unless you are sure of what the piece of code does to the functioning and appearance of your widget, do not mess with it, else you might screw it all up and will have to go through the process again. One more thing that we would like to add is related to the weather widgets. Stay clear of these and do not download them. They are not infested with viruses or something along those lines. But, the thing is

The widgets folder, with the calendar widget in there

Change the values as you like, make the font big or small. All is up to you

that they simply won't work. The reason is that almost all of them were made

using the DarkSky API, which was bought by Apple last year, meaning that the devs on the open market do not have access to them anymore, as they are not accepting any new signups. That's a bummer, we know, and we did not want you to get hyped up for nothing. You can code your own widget, though, if you are well versed with the digital art of coding and have the right resources. And if you do, please upload it to the Widgets Gallery, if you want. [d](#)
