

### Drones to patrol Dubai?

Dubai police will use a citywide network of drones to respond to crime. <https://digit.in/aug21-09>

### Metaverse: internet revolution

Imagine a world where you could conjure up a virtual version of your workplace while at the beach. <https://digit.in/aug21-10>

# Siri on the system

Hey Siri. Are you safer now?

any of the tech giants of the world are competing to make their AI assistants better by the second.

For Apple, the company in focus, it all started with Siri, way back in the year 2011 when it was introduced for the first time as an integrated software. At the time, it was not received well. But fast forward 9 years, Siri and its competitors in the market, like the Google Assistant and Amazon Alexa, have come a long way, becoming an essential part of many of our lives.

They can do it all. Want to set the alarm? Just give Siri a shout out. Want

to save the date for your friend's 15 work anniversary? Siri or one of its counterparts will be there to your rescue. And that's all free. Too good to be true, right? Companies are spending countless man-hours and millions to make your life easier. Well, as it turns out, it is indeed too good to be true. There is a hidden cost that has come to be the focus of many discussions all over the world. That is data collection. It is basically the tax that you pay to the companies to let them use their services for free.

You know about it, but you don't. There have been several cases of people and institutions filing lawsuits against the companies accusing them of collecting their data in terms of unauthorised voice recordings and using it for their own research, keeping the end-user in the dark. This, to some extent, is true, and the fact that courts have ruled against the com-

panies is a testament to this problem. But what's the solution? Well, Apple has answered the call. While their own collars are not without stains, what they announced recently could potentially be a great move from the consumers' perspective.

Apple, in their recent World-Wide Developer Conference (WWDC), made a big announcement regarding their home grown, almost decade old AI voice assistant, Siri.

Want to know the weather? Well, we might record your phone call
