afe Cams makes AI integrated dashboard cameras for vehicles, with innovative safety oriented

features that have emerged from local conditions. These cameras can be easily fitted onto a vehicle, and are available in consumer and fleet options. There are models that can monitor the vehicle 24x7 as well as really fancy ones with Wi-Fi connectivity, a companion app, GPS tracking and a touchscreen. The cameras for fleet vehicles offer even more advanced smart capabilities, such as the ability to track reckless driving, or if the driver is feeling drowsy. The cameras actually use gesture tracking to figure out if a driver is smoking or using the phone. These are

thoughtful features, designed for local conditions. We spoke to Mr. Vanesh Naidoo, Founder and CEO of Safe Cams about the design and development of these products.

Naidoo told us that a familiar experience was what led to the formation of the company, “when I came to India after spending around 14+ years in the UK, I found it very difficult to drive on roads; as most drivers either did not know about the rules of the road or did not really care to follow them. I was afraid of meeting with an accident, and even if I was correctly following the rules, of being blamed for an accident! I noticed that many times whenever there is an accident, a crowd gathers around, and it can sometimes turn violent.”

The problem was that there just wasn't a suitable dashboard camera on the market, “In view of such observations and anticipated dangers on roads, I decided to buy a dash camera for my car, but when I looked for one (both online and offline), I could not find any quality dash camera. So, I ended up importing a dash cam from

the UK. At the same time, I thought about opening an Indian brand for dash cameras – since India is growing, and its automobile industry is the 5th largest in the world.

However, many cars were not being sold with basic safety features like airbags and ABS braking which was a standard in the UK. This is how the idea of forming a dash camera and road safety-tech Indian brand – Safe Cams – came to my mind.”

These are not passive dashboard cameras that just provide a video record of what is going on inside and outside the vehicle. The cameras use the tech to the fullest extent possible, monitoring both the driver of the vehicle as well as the surroundings and providing real time contextual alerts, all aimed towards preventing accidents before they happen. Naidoo says, “with speeding and drowsy driving accounting for nearly 80% of road accidents, Safe Cams' Driving State Monitor (DSM) and Advanced Driving Assistance System (ADAS) are providing a novel solution to this growing
