

the option that was labelled as 'Tweet' has now been changed to 'Tweet at *Date*'.

Confirm the time and date again and click the button. A new column will appear carrying the information of all

A list of scheduled Tweets

the Tweets that have been scheduled. You can head over to that column and click on the small pencil icon on the Tweet if you wish to change anything, be it the content or the scheduled time and date. Click on the Tweet at button again to save the changes to your scheduled Tweet.

UNDERSTAND THE SENTIMENT

Over the last decade or so, Twitter wars and debates have become a real thing, with users of the platform taking to it, in order to express their opinions on the latest

Results of a sentiment defined search

trending topics. By using the Sentiment feature of TweetDeck, you can find tweets corresponding to the sentiment you enter.

To do this, when searching for a keyword, you can add

either the smile emoji ":" or the sad emoji ":(" If you hit search after adding these emojis, TweetDeck will show you search results corresponding to the sentiment that you attached

with the keyword.

For example, if you search "India :)", you will see Tweets about India written in a positive sentiment.

APPLY FILTERS, THE USEFUL ONES

When searching for something on Twitter, users sometimes find themselves battling with a Tweet wave coming their way. Twitter search just looks up the keyword and throws at you, every Tweet that has that keyword. With TweetDeck, you can add filters to your search and refine the results to get what you want.

In order to add filters to your search, you will need to go to the search option, which by default is in one of the columns of the TweetDeck desktop website, and instead of hitting enter or search after typing your keyword, look for the following icon "⚙️". Click it and you will be presented with a host of filters which you can pick and choose according to your needs. These filters are categorised as follows – Tweet content, Location, Authors and Engagement, each having its own purpose.

Tweet Content lets you decide what type of Tweets you want to see, for example, the ones with images or GIFs only. It also lets you exclude certain keywords, select the dates, language and Retweets, if

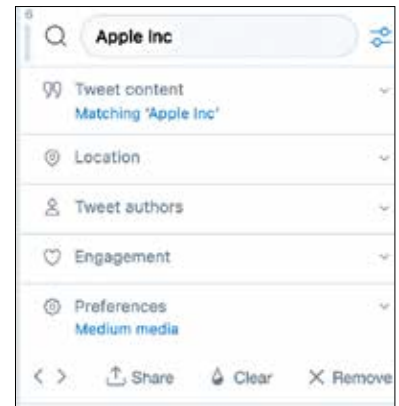

you want to include them. The location filter, as the name suggests, lets you decide where you want the Tweet to have originated from. Then come the two options that would interest researchers and analysts a lot. The Tweet Authors and Engagement filters. The Authors option lets the users see which author they want the Tweet from and which ones to exclude, and the Engagement Filter, lets the users decide the number of Likes, RTs, or Replies that a Tweet must have to appear in the results.

USE THE ALL-MIGHTY ASTERISK

All the Windows aficionados would be familiar with using * for replacing keywords in their searches. While stock Twitter does not have it, TweetDeck is here to the rescue. It has the ability to let users to add *, better known as Wildcard, to keywords while searching the platform.

It works similar to the other platforms that have wildcard search. All you need to do is, while in the search bar, add the asterisk to the end of a phrase and you will be presented with all the Tweets that have the key phrase in it. For example, if you enter "MacBooks are *" in the search bar, the results will have Tweets having text like "MacBooks are expensive",

The Filters menu

"MacBooks are great", and so on. This is a useful filter that enables users to yield better search results without tinkering with the complex filter settings.

STEPPING UP YOUR SEARCH GAME

While all the search options and tricks that have been discussed so far may yield a lot of useful results, for all the
