CHICKEN SOUP - FOR THE GPU SHORTAGE

These temporary options will keep you satisfied till you can buy a new GPU.

Kshipra Jadav | feedback@digit.in

T

he great GPU shortage of 2021! Everyone knows about it. Don't worry, if you don't, let us get

you up to speed. You see, the pandemic caused major supply chain issues which resulted in monumentally higher costs for the manufacturer to ship graphics cards all over the world and that's on top of the price hikes owing to reduced manufacturing output. Factories weren't working at the same speed because of the pandemic. Also, as more people started working from home, they wanted to build new PCs and this caused a spike in demand, which again compounded the price of GPUs. And in the midst of this spike in demand and drop in supply, Cryptocurrencies saw a sudden surge in value. We all know that the previous graphics card shortage was because of crypto-mining and this new surge in crypto caused miners to seek out as many graphics cards as possible because, as it turns out, graphic cards are still excellent at mining cryptocurrencies. And if all this wasn't

enough, we also have to deal with scalpers. Scalpers use special scripts to automate their buying process which obviously is faster than a human can click. They get their hands on a graphics card and then sell the same for almost double the price. Miners on the other hand use those graphics cards to mine cryptocurrencies which ultimately leaves us, the gamers with nothing in hand.

you don't have to buy a graphic card at all! The Integrated Graphics Processor (IGP) on your CPU should tide you over till then. A CPU with integrated graphics is also called an APU. The term was coined by AMD but is now synonymous with processors from both manufacturers.

This changes the game completely. You see, if you bought a CPU without an IGP then you would

This image alone is enough to make us drool.

This was a short history of the great GPU shortage of 2021. For the gamers, it is hard to say when the prices will normalise. But what if you want to build a shiny new gaming PC right now? What if you cannot wait another six months for the graphics card prices to normalise? Well, you obviously don't have to buy a GT 710 to compensate for the lack of a graphics card in your system. Infact,

NEED a graphics card in order to get a display signal. Whereas, APUs do not need a discrete graphic card to get a display signal out. You can just hook your HDMI cable to your motherboard's HDMI output and get a signal. Cool then, why do we even need graphic cards if we have APUs? Well, obviously APUs aren't as powerful as discrete graphic cards but they are powerful enough to serve as
