

### Ray-Ban x Facebook glasses

Mark Zuckerberg announced that Facebook will be partnering up with Ray-Ban to make smart glasses. <https://dgit.in/aug21-69>

### Physical > NFT

Steve Jobs' 1973 physical Job Application sold for \$300,000 more than its digital NFT counterpart. <https://dgit.in/aug21-70>

All in all, the Intel i3 - 10100 serves as a good CPU and an okay-ish GPU. It will definitely hold its place till you get your hands on a discrete graphic card.

The second and the last contender we have for this 'Budget Build' is from Team Red! The Ryzen 3 3200G offers 4 cores and 4 threads with a base clock of 3.4 GHz and a boost clock of 4 GHz. This budget CPU from mid-2019 offers decent graphics performance with its inbuilt Radeon RX Vega 8 graphics.

If you want to opt for AMD CPUs then this will be your best bet as of now. Coming at just around ₹9,000 INR, this APU offers good CPU performance as well as a decent GPU performance. In some cases, it is even better than the above mentioned Intel UHD Graphics 630.

To the people concerned with the numbers, the Radeon RX Vega 8 offers decent graphics performance at both 720p and 1080p resolutions. Although it is not recommended, you can overclock the chip to extract even more juice out of it. Rest assured, the APU can handle almost any game you throw at it provided you are willing to lower your expectations quite a bit. But

still, it holds its ground pretty well with older titles even at 1080p. All the benchmarks were taken at 720p and 1080p using a mixture of Low to Medium settings.

At the end, it is all about which sacrifice you are willing to make for

the CPU. If you want more threads, a better CPU performance and a newer CPU then you should opt for Intel i3 10100 BUT if you are willing to sacrifice that bit of CPU performance for the extra GPU performance then you should go for the Ryzen 3 3200G.

### THE MID RANGE BUILD

This mid ranger aims to provide you the best of both worlds. Productivity and gaming. It will provide you decent performance at 1080p but is not recommended for 1440p or 4K

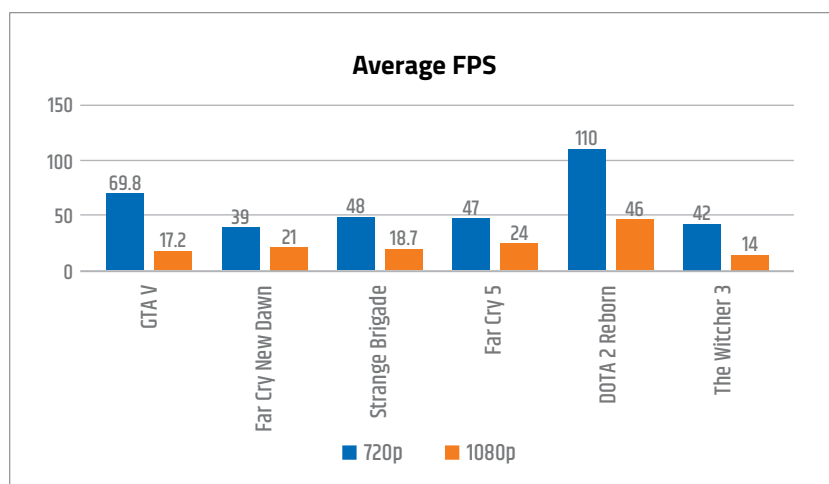

gaming. Looking from the productivity standpoint, this build will also give you respectable render times and snappier performance than the 'Budget Build'. Hence, we think that most people should have no performance issues with this build.

### The 'Mid Range Build' – around ₹70,000

Before we take a look at the contenders for this build, we'd like to tell you that in this price point, there are very few options offered by Team Blue that can compete with Team Red, especially in the Integrated Graphics department. Here, AMD has a clear advantage over Intel as it provides an exceptional balance between CPU performance and GPU performance. If you'd like to go with Team Blue even with this budget, we'd seriously recommend getting a discrete GPU at all costs as the Integrated Graphics is not competitive. Hence, since this is an APU centric article, we'd only be covering contenders from AMD.

The first and the only contender we have here is the AMD Ryzen 5 3400G with Radeon RX Vega 11 Graphics. Talking about the CPU, it has 4 cores, 8 threads with a base clock of 3.7 GHz and a boost clock of 4.2 GHz. Also, as a bonus, the CPU can be overclocked too! This APU will cost you around ₹17,000 (price subject to heavy change) but it is worth every penny.

Coming to the gaming performance of the RX Vega 11, it provides a comfortable 60+ FPS on most games with low settings and if you are willing to sacrifice some of the FPS for quality, then you can get away with 25-30 FPS on Medium settings. As you can see in the below benchmarks, all of the games provide a decent playing experience. All of the benchmarks were taken with a mixture of Low, Medium and High settings. If you understand the different graphics settings and their effect on visual quality, then you can optimise each game's settings and get even more performance.

AMD Ryzen 3 3200G - Radeon RX Vega 8 Graphics
