Teardown: OnePlus Watch

First-generation smartwatch-cum-fitness tracker from OnePlus

Dhriti Datta | dhriti@digit.in

Disassembly time!

The first things to be disassembled are the straps of the OnePlus Watch. The fluoroelastomer straps are held in place with standard spring bar pins and can be easily removed. After that, four Torx screws hold the back of the watch in place. Removing those reveals the insides and you can see the back cover of the watch housing a Li-ion battery and some more components.

The back cover

Aside from the battery, the back cover of the OnePlus Watch houses a speaker, linear actuator, microphone, barometric sensor, heart rate sensor and SpO2 sensor. A single metal bracket covers the cable connectors. Most of the components listed above are placed on a flex cable that is not removable. The only replaceable part here is the loudspeaker.

Examining the battery

Closer examination of the power cell shows that it is capable of delivering 1.59 Wh power (410 mAh @ 3.87 V). This is a tad higher than the 1.3 Wh battery in the Galaxy Watch 3 and significantly higher than the 1.17 Wh battery in the Apple Watch Series 6. Only the Xiaomi Mi Watch provides more power with a 1.62 Wh battery.
