Current and future trends in Elevator industry

As urbanization continues to grow, the need for housing and commercial space will grow, which will increase the demand for vertical transportation. The Oxford Economics' Global cities report estimates that India will have 17 out of 20 fastest-growing cities globally between 2019 and 2035, and Indian cities are likely to contribute to 70% of India's GDP by 2030.

Significant innovations and advancements such as the launch of smart elevators, rope-less elevator-MULTI, AI, and Internet of Things, extended reality technology have changed the overall face of the elevator industry. It has made vertical transport easy and smart in the past few years. It is an exciting time for the elevator industry. As the technology evolves, the elevators, their maintenance, their upgradation will also evolve simultaneously. The future of elevator systems will be more energy-efficient and safe.

Digitalization has opened new values for the industry, and this era brings innovations that changed the industry significantly. With the usage

of IoT, elevators can virtually talk to us, tell us when they need help, and even advise technicians on the cause and solution in combination with AI and machine learning. So, it can be fixed before customers even realise there's an issue. This proactive customer service is all about the ability to understand customers' needs and address them before they grow because downtime of an elevator is likely to block many people's mobility, especially in mid or high-rise buildings, which can cause a significant delay in work.

Having said that, innovative technology solutions like TK Elevator's MAX can detect and predict every issue beforehand. These properties of smart lifts save a lot of time and cost. With VR, the technicians don't even have to go to the site to test the problem. Proactive repair makes the lifts extremely time-efficient.

Lifts are now not limited to vertically moving; they can move horizontally as well. TK Elevator's "MULTI can give you this innovative experience." It is the world's first rope-free elevator that moves multiple cars in

a single shaft vertically and horizontally. It reduces elevators' footprint by up to 50 percent while increasing passenger throughput. It will save passengers time as well.

This innovative technology has changed the concept of elevators in tall building construction. MULTI is set to revolutionize tall building construction. The door is designed in such a way that it can open in all four directions. With MULTI's rope-free system, architects and developers are no longer restricted in their designs by concerns about elevator shaft height and vertical alignment.

New technological innovations in the elevator have changed the industry. Based on Machine Learning that day is not far when elevators will recognise consumers and predict where they are going. In the future, when people ride elevators, streaming services and content in the cabin will not only be adapted to the time of the day but specially catered to individual passengers. **d**
