

SECURITY WATCH

Malicious version of WhatsApp messaging app

Kaspersky discovered a malicious version of WhatsApp messenger mod (an unofficial modification of the app) dubbed FMWhasapp. This modded version of WhatsApp spreads the Triada mobile Trojan which is capable of infesting the device with other Trojans. It can also launch ads, issue subscriptions, and even intercept users' SMSs. WhatsApp is one of the most popular, if not the most popular, mobile messaging app. However, some users still look for modified versions of the app with added features such as choosing dynamic templates and reading deleted messaging. Such modded apps often publish ads to monetise their work. However, scammers can take advantage of this by distributing malicious code via adverts. The 16.80.0 version of FMWhasapp distributes the Triada Trojan via this method. This Trojan acts as a mediator in this app and collects data about the user's mobile device.

MOBILE WATCH

Apple iPhone 13 series

Apple will allegedly launch its new iPhone 13 series in a launch event on September 14, a new report claims. The series will include four phones – iPhone 13 mini, iPhone 13, iPhone 13 Pro, and iPhone 13 Pro Max – that are expected to be up for pre-order starting September 17. The new iPhone 13 phones aren't likely to be a major deviation from the existing iPhone 12 lineup in terms of design and features. Rumours suggest that Apple could be implementing a new diagonal camera sensor placement with some of the iPhone 13 phones. We can definitely expect some generational improvements in camera performance, a new and faster A-series chipset, Qualcomm's new 5G modem, and some improvements in display technology. The highlight could be iPhone moving to LTPO AMOLED displays with a fast 120Hz refresh rate this generation.

APP WATCH

AR Canvas

Last year, Samsung discontinued Bixby Vision's AR features such as Places, Makeup, Home Decor and others. However, Samsung has now brought back some of these features with a brand new app dubbed AR Canvas. The new app allows users to utilise their creativity and decorate spaces around them with digital AR elements such as 3D text, 2D images, and GIFs. The AR content added by the

user to the space is anchored in place for 30 days. This allows them to revisit their work and make changes if necessary. All you have to do is launch the AR Canvas app, point your phone's camera at the spot you've added an AR element to, and then tweak it to your heart's content. In order to add AR elements to your IRL surroundings, download the AR Canvas app via Samsung's app store or from the Google Play Store and give the app all the necessary permissions including location, camera, microphone, and storage. Tap on the

'+' icon at the bottom right of the screen to create a new AR scene. This will open up the Scene Editor within the app that gives users a bunch of tools to add AR elements to their surroundings. The app is a good way to add some fun elements to your regular surroundings, be it for social media posts, or simply to allow your children to try their hand at creating a unique space. There's not a lot more you can do with the app apart from what we've mentioned at the moment, but the company could keep adding features.

Water Resistance Tester

This app tests your device's water resistance by using its barometer. Download the free app, follow the prompts to press down on the screen, and you'll get an idea of the water-resistant sealing on your phone.

Snap Search

Snap Search is a free incognito browser for Android that focuses on privacy. It asks for zero permissions, comes with a free VPN, and even clears history, cookies and sessions every time you exit the browser.

Slurrp

Slurrp is a recipe aggregator app that helps people find recipes according to their diet choices, fitness goals and taste preferences. It provides calorie counts of meals and even provides information on nutrients.
