tips and tricks that will help you get that extra bit of work from the app.

Make your own templates

If you are in the habit of taking down notes in the same format, repeatedly, then Agenda simplifies the process of having to copy and edit the formats repeatedly. You can just save a piece of starting text that is common to these formats, and make your own templates out of them, to be used every time you make a note in that particular format.

To create a template from a project and select the block of text that you want to make a template out of. When you click on the text block, a tiny gear icon that looks like this will appear on the bottom right corner of your block of text. Click that, and a drop-down menu will appear, having the option labelled as Save As Template. When you press that, the block of text will be saved as a template. The saved templates from the app can be managed using the Template Manager, which can be found inside the Windows tab on the top menu bar of the app.

Set in-app reminders

Many times, it happens that a meeting or a task slips under the radar and is left out because you were busy with writing or creating and managing a project on an application, while the reminder went off in another window altogether. In Agenda, there is a very useful option to add reminders to tasks in a project that you have created in the app.

To add a reminder to a task, you will first need to locate and click

the task that you want to add the reminder to. Then, a small circle will appear on the left end of the task. When you click that end, you will find a host of options appear, from which you will have to select the one labelled using a tiny red alarm clock. Once you are in, you will be shown the calendar, using which you can add a reminder to your task. When a reminder has been assigned, a grey-coloured icon similar to a stopwatch will appear next to the task.

Design your own notes

Formatting extensive projects can be tiring. Agenda makes this easier as well, as you can add your own style to the text you type out in the application. To do this, all you need is to click on the small circle that appears when your cursor is in a text block. There, you will find a lot of options, right from making selections to strike through the text or increasing and decreasing the font size to make a text a heading or subheading. From here itself, you can accomplish other tasks as starting a numbered list or checklist, which can be added reminders to, as we told you earlier.

Sync the dates

You do not want dates for scheduled events clashing or overlapping with one another. To avoid this from happening, the developers at Agenda added a neat feature, using which you can sync your Apple device's calendar with the application. For syncing your calendar, you will again have to be in a selected block of text. When there, a small calendar icon will appear on the top right corner of the

block. Click that icon, and you will be prompted to give permission to the app to take events from your calendar and place it here. Once provided, the application will automatically import all of your events from the device calendar into its own, letting you keep track of your dates better.

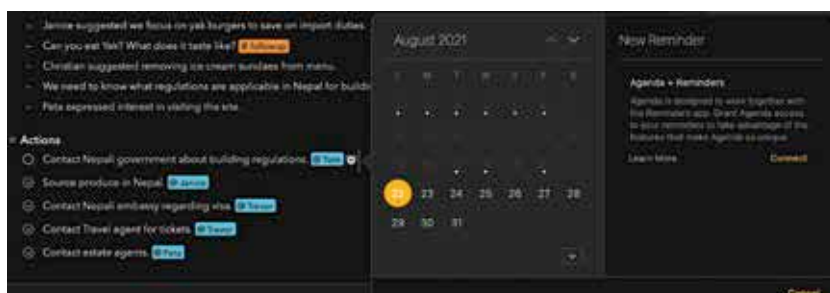

RECTANGLE

MacOS, since the start, has been missing one key feature, which Windows users have enjoyed. This is the automatic alignment of windows on the screen when they are moved around. To this date, with MacOS

The menu where the designing happens

being in its 11th iteration, there is no way users can move around, resize and align windows without going through a lot of hassle. Snapping windows to the edges seems like a no brainer, but the folks at Apple seem to disagree. Coming to the rescue of Mac users is an application called Rectangle. Developed by Ryan Hanson using Swift, Rectangle is an open-source software that can be loaded onto your Mac. As written on its website, this app helps you "Move and resize windows in macOS using keyboard shortcuts or snap areas". Rectangle goes beyond the simple snapping features though, and provides users with a host of other powerful capabilities, that makes working with multiple windows easier, and can all be done with the keyboard,
