

While that is for the MacOS, Microsoft Windows too has its own app in PowerToys, called Fancyzones. With Fancyzones, you can divide your screen space into sections where you can just simply drag and drop windows into, and they will shapeshift to occupy that space.

Using it is so easy that when you have PowerToys on your computer, running and the Fancyzones enabled, all you have to do is mouse over to the window that you want to reposition, and the zones will automatically appear as you click and hold to drag it. Drag the window to the desired zone while holding the left mouse button, and release the window in the zone you want to place it in.

To set up your own custom space, inside the PowerTools settings menu, and head over to the Fancyzones section. There, go to the big blue button labelled as launch layout editor. A new window will open, containing the various pre-configured options for you to choose from. Here, if you find your layout, select it, and you will be done. Else, if you want to tweak it a bit, you can click on the pencil-shaped icon on the option card, where you will be greeted by the customization menu for that particular preset zone division.

Say, if you are not able to settle on a zone layout even after configuring all the preset zone cards. You can create your own zone by mousing over to the bottom right corner and clicking on the button labelled as, create new layout. That will open a new window, where you can name and change the way you want your own

Fancyzones editor in use

layout to function. In the main menu of Fancyzones, if you scroll down a bit, you will also find the options that will help you change things like the zone highlight colours. There, you can even select the apps that you would want to exclude from getting put into zones when you are dragging them around on the screen.

IMAGE RESIZER

There must have been times where you would have wanted to change the dimensions of an image to upload it onto a website or place it in a digital space. This is a simple enough procedure that is hard to do with a basic image editor such as Paint, does not really require a full fledged photoediting software such

as Photoshop, or a batch editor such as IrfanView, so it is kind of in a strage zone of its own. This is where the shiny new Image Resizer tool of PowerToys proves to be really handy, you can resize images in the blink of an eye right on your own device, without having to depend on shady sites with malware, popups and privacy concerns.

To use the Image Resizer, go to the image that you want to change the dimension of, and right-click it. From the dropdown, select the resize pictures option. A new window will pop up with all the relevant options. Choose the right size that you want to change your picture to and click resize. The resized images will be stored in the same folder as

the original image file. In the Image Resizer tab, inside of the PowerTools settings menu, there are options to change the scaling of the image for every preset. Say, if you want your large image to be of the resolution, 1920 x 768, you can change the value of the same by clicking the pencil-shaped button located in the tile that you want to change the value of.

If you want to change the filename format, you will have to scroll all the way to the bottom of the Image Resizer menu, where you will find the option called File. Here, there will be a small textbox that will have certain modifiers in it, which are essentially numbers prefixed by %. This is what you will have to change. To get the desired filename format, you change the combinations of these modifiers and get the result. For example, if you want the file name to have the original file name, followed by the size name, you will have to put in the textbox the parameter %1 (%2). Here's what each modifier adds to the file name format: %1 – Original Filename, %2 – Size name, %3 – Selected width, %4 – Selected Height, %5 – Actual width, and %6 – Actual height.

POWERTOYS RUN

Everyone who has used MacOS knows how wonderful a utility the Spotlight search is. Well, the Windows developer team seems to have taken a page out of Apple's book, and have brought something like Windows machines in PowerToys, called the PowerToys Run. It is like a stripped down version of the almighty Run feature that we have had for years on Windows.
